

Conservation Security Program

Hayland Fact Sheet

Utah, 2005

What is the Conservation Security Program (CSP)?

CSP is a unique new program that offers payments for topnotch conservation farmers and ranchers. Unlike other programs that help producers fix resource problems, CSP rewards those who already act as model conservationists. It also pays qualified producers to do further environmental enhancements, such as additional conservation treatments, evaluation, on-farm demonstrations and more.

CSP is a three-tiered program with different requirements for each tier. All CSP producers, regardless of the tier at which they participate, must ultimately address minimum treatment criteria for soil quality and water quality. Techniques to achieve these soil and water quality criteria will vary depending on your farms slope, climate, soil texture and other characteristics. Typically, sound resource management will include activities such as those shown below and will result in fertile soil with valuable organic matter that is protected from erosion. Additionally, pesticides and nutrients will be managed to help keep surface and groundwater clean to protect human and environmental health. For hayland, consider the following checklist.

Do you currently . . .

- **Rotate your crops?**
- **Control erosion or soil loss?**
- **Test soils and apply fertilizers appropriately?**
- **Keep written records of fertilizer and pesticide applications?**
- **Schedule irrigation applications based on crop needs?**
- **Are you willing to pursue additional conservation enhancements?**

Producers in the three selected Utah watersheds may qualify for CSP if they are addressing natural resource concerns on their hayland by:

- Using a conservation crop rotation that includes high residue crops, alfalfa, or pasture in the rotation.
- Applying fertilizer according to university recommendations.
- Collecting soil test information and keeping records of fertilizer and pesticide applications.
- Controlling soil erosion.
