Soil Survey of Elko County, Nevada, Northeast Part Part I

How To Use This Soil Survey

This survey is divided into three parts. Part I includes general information about the survey area; descriptions of the detailed soil map units and soil series in the area; and a description of how the soils formed. Part II describes the use and management of the soils and the major soil properties. Part III includes the maps.

The **detailed soil map units** follow the general information about the survey area. These map units can be useful in planning the use and management of small areas.

To find information about your area of interest, locate that area on the **Index to Map Sheets**, note the number of the map sheet, and turn to that sheet.

Locate your area of interest on the map sheet. Note the map unit symbols that are in that area. Turn to the **Index to Map Units** in Part I of this survey, which lists the map units by symbol and name and shows the page where each map unit is described.

The **Summary of Tables** shows which table has data on a specific land use for each detailed soil map unit. See **Contents** for sections of this publication that may address your specific needs.

A **State Soil Geographic Database (STATSGO)** is available for this survey area. This database consists of a soils map at a scale of 1 to 250,000 and descriptions of groups of associated soils. It replaces the general soil map published in older soil surveys. The map and the database can be used for multicounty planning, and map output can be tailored for a specific use. More information about the State Soil Geographic Database for this survey area, or any portion of Nevada, is available at the local office of the Natural Resources Conservation Service.

Some standards or values may change as more information is collected and analyzed. Thus, as older published interpretive information becomes outdated, new interpretive data must be generated and tailored to local conditions. This information is added to the State Subset of the **Map Unit Interpretation Record (MUIR)** database as needed. Map Unit Interpretation Records are the soil survey specific data and interpretations in the state soil survey database.

This soil survey is a publication of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service has leadership for the Federal part of the National Cooperative Soil Survey.

Major fieldwork for this soil survey was completed in 1990. Soil names and descriptions were approved in 1990. Unless otherwise indicated, statements in this publication refer to conditions in the survey area in 1990. This survey was made cooperatively by the Natural Resources Conservation Service and the U.S. Department of Interior, Bureau of Land Management, and University of Nevada Agricultural Experiment Station. It is part of the technical assistance furnished to the Lincoln County Conservation District.

Soil maps in this survey may be copied without permission. Enlargement of these maps, however, could cause misunderstanding of the detail of mapping. If enlarged, maps do not show the small areas of contrasting soils that could have been shown at a larger scale.

The United States Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, gender, religion, age, disability, political beliefs, sexual orientation, and marital or family status. (Not all prohibited bases apply to all programs.) Person with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact the USDA's TARGET Center at (202) 720-2600 (voice and TDD).

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326W, Whitten Building, 14th and Independence Avenue, SW, Washington, DC 20250-9410 or call (202) 720-5964 (voice or TDD). USDA is an equal opportunity provider and employer.

Foreword

This soil survey contains information that can be used in land-planning programs in Elko County, Nevada, Northeast part. It contains predictions of soil behavior for selected land uses. The survey also highlights limitations and hazards inherent in the soil, improvements needed to overcome the limitations, and the impact of selected land uses on the environment.

This soil survey is designed for many different users. Farmers, ranchers, foresters, and agronomists can use it to evaluate the potential of the soil and the management needed for maximum food and fiber production. Planners, community officials, engineers, developers, builders, and home buyers can use the survey to plan land use, select sites for construction, and identify special practices needed to ensure proper performance. Conservationists, teachers, students, and specialists in recreation, wildlife management, waste disposal, and pollution control can use the survey to help them understand, protect, and enhance the environment.

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are shallow to bedrock. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

These and many other soil properties that affect land use are described in this soil survey. The location of each soil is shown on the detailed soil maps. Each soil in the survey area is described. Information on specific uses is given for each soil. Help in using this publication and additional information are available at the local office of the Natural Resources Conservation Service or the Nevada Cooperative Extension.

Soil Survey of Elko County, Nevada, Northeast Part

By Paul W. Blackburn, Natural Resources Conservation Service

Fieldwork by Paul W. Blackburn, Terry S. Bowerman, Rod Douglas, Alan Wasner, Dennis W. Worrel, Natural Resources Conservation Service

United States Department of Agriculture, Natural Resources Conservation Service,
and United States Department of Interior, Bureau of Land Management
in cooperation with the University of Nevada Agricultural Experiment Station

How This Survey Was Made

This survey was made to provide information about the soils and miscellaneous areas in the survey area. The information includes a description of the soils and miscellaneous areas and their location and a discussion of their suitability, limitations, and management for specified uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They dug many holes to study the soil profile, which is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

The soils and miscellaneous areas in the survey area are in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind or segment of the landscape. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landscape, soil scientists develop a concept, or model, of how the soils were formed. Thus, during mapping, this model enables the soil scientists to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Individual soils on the landscape commonly merge into one another as their characteristics gradually change. To construct an accurate map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted color, texture, size, and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could

confirm data and assemble additional data based on experience and research.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

The descriptions, names, and delineations of the soils in this survey area do not fully agree with those of the soils in adjacent survey areas. Differences are the result of a better knowledge of soils, modifications in series concepts, or variations in the intensity of mapping or in the extent of the soils in the survey areas.

General Nature of the Survey Area

This section gives general information about the survey area. It briefly discusses history; industries, transportation, and recreation; physiography, drainage, and geology; and climate.

History

This area was originally inhabited by the tribes of the Shoshone Indians. Fur trappers first passed through this area in 1828 on their return trips from the Sierra Nevadas. Many emigrants passed south of the survey area in the 1830's and 1840's until 1850, when the Overland Trail was established and people began to travel through and settle into the area. The Trail followed Goose Creek down to Thousand Springs (which became a major winter camp for many emigrants), then along Bishop Creek and into Wells. From Wells, the Trail followed westward along the Humboldt River.

The Overland Trail opened the door to communications from the east to the west, by 1851 the first mail service entered Nevada using the Trail as its main route to California.

Sheep ranching was the first livestock industry to get its start in the area. In 1852, the sheep were herded to California across the Overland Trail. From 1865-1880 supply and demand reversed and many sheep were herded back along the Trail to the markets back east. By this time, many stockmen had settled in the area and the sheep became a common sight on the rangeland.

The cattle industry was not far behind. In 1854, Thousand Springs became a major "trading post" where emigrants could trade their tired, hungry cattle for fresh and fattened cattle to continue their journey to California. This proved to be very successful for the stockmen in the area. Also, herds were being driven north from Texas and Mexico, and when it was discovered that these "southern" cattle could survive the winters here, stockmen began to settle in the area. By 1880, permanent herds of cattle had joined the sheep on the rangeland.

In 1870, a mining camp called Contact was built to accommodate the gold, silver, and copper mines of the surrounding area. But, like many mining camps of northeast Nevada, Contact died when the mines were closed.

Just north of Wells, an agricultural empire was to be created in the early 1900's. The city of Metropolis was developed in the midst of 40,000 acres of cultivated fields, but when the developers lost the water rights in a law suit, the city, like the mining towns, vanished.

The communities created by the railroads prospered much longer. Montello became a freight center for the Southern Pacific Railroad in 1902, and

continues to serve the existing railroads. Tecoma was opened by the Central Pacific Railroad as a shipping town for the Tecoma mines, and it remained opened until the 1960's.

Perhaps the youngest, and the most prosperous community of this survey area is Jackpot, which opened as a casino in 1956. The Horseshu Club was the first casino, followed by Cactus Pete's. The name, Jackpot, was not given to the town until 1959. The town has expanded rapidly since its birth. It is a major tourist attraction for northeast Nevada.

Industry, Transportation, and Recreation

The main industries in the survey area are ranching and mining.

The ranches are dominantly cow-calf operations, usually weaning and selling the calves in the fall of the year. A few operations carry over yearling steers to be sold at a later date. There are a limited number of ranches that are cow-calf and sheep operations.

The crops grown are dominantly meadow hay with some small areas of alfalfa.

There has been some mining of gold, silver, and barite in the past, but at present there is little mining activity in the survey area.

The area is so sparsely settled that there is little need for improved roads. In summer and fall most of the survey area is accessible by dirt roads or jeep trails.

There are two main highways in the survey area. These are U.S. 93 which runs from Wells to Jackpot, and State Route 233 which runs northeast through Montello and Tecoma Valley.

The area is served by the Southern Pacific and Union Pacific Railroads.

Physiography, Drainage, and Geology

The northwestern quarter of the survey area including O'Neil Basin is drained by Salmon Falls Creek and its tributaries. Salmon Falls Creek flows in a northerly direction into Idaho and the Salmon River outside of the survey area.

The northeastern corner of the survey area is drained by Goose Creek and its tributaries. Goose Creek flows in a northeasterly direction into Idaho and Oakley Reservoir where most of the water is used by agriculture.

The southern half of the survey area is drained by Thousand Springs Creek and its tributaries.

Thousand Springs Creek flows east into Dake Reservoir. It then either evaporates or percolates into the ground in Utah outside of the survey area.

The southwestern corner of the survey area is drained by Bishop Creek and Tabor Creek and their tributaries. These creeks flow southwest into the Humboldt River outside of the survey area.

A small part of the extreme southern part of the survey area is drained by the Humboldt River and several small tributaries. The Humboldt River flows west of the Humboldt Sink outside the survey area.

The northern quarter of the survey area occurs within the Payette section of the Columbia Plateau Physiographic Province. In this area, the Columbia Plateau is characterized by broad plateau-like formations mainly comprised of welded and nonwelded silicic ash-flow tuffs and rhyolite. Typical soils derived from this material include the Ackett, Bluehill, Chayson, Chuska, Jackpot, Tomsherry, and Xerxes series.

The scattered hills and mountains in the Payette section in this area consist mainly of Permian limestone and dolomite, with smaller areas of Jurassic granitic rocks. Typical soils derived from this material are the Agort, Gollaher, Hapgood, and Xica series.

The valleys in the Payette section in this area consists of quaternary alluvial deposits. These deposits make up the floodplains and fan piedmonts. Typical soils formed in these deposits include the Devilsgait, Dewar, Donna, Enko, Peeko, and Sonoma series.

The southern three quarters of the survey area lies within the Basin and Range Physiographic Province. In this area, the Basin and Range is characterized by north trending, narrow mountain ranges which alternate with intervening basins and valleys.

The mountains are mainly comprised of lower Paleozoic to Permian limestone and dolostone. Typical soils formed in these rocks are the Amene, Amtoft, Belsac, Gollaher, and Nirac series.

Rocks such as quartzite, chert, siltstone, conglomerate, and argillite are found in lesser amounts in the mountains. These rocks range in age from Cambrian to Devonian. Typical soils found on these are Arcia, Cleavage, Hapgood, and Sumine series.

The hills in this area of the Basin and Range are mainly comprised of Tertiary welded and nonwelded silicic ash-flow tuffs with locally large areas of rhyolite and quartzite. Typical soils derived from this material are the Cobre, Hundraw, Izar, Pernty, and Puett series.

The valleys in this part of the Basin and Range are mainly composed of quaternary alluvial deposits and the Humboldt Formation. The Humboldt Formation consists of lake beds, ash, tuff, and clastic deposits laid down by streams. Typical soils found in these deposits are the Donna, Stampede, Hunnton, Wieland, Enko, and Peeko series.

There are internally drained basins in the Southeast part of the survey area. They are mainly comprised of fan piedmonts, alluvial flats, and lakeplains of quaternary clastic deposits, and lake sediments that are influenced by ancient Lake Bonneville. Typical soils formed in these deposits are the Gravier, Kawich, Luap, Ocala, Pibler, and Sondoia series.

Climate

Prepared in part by the National Climatic Center, Asheville, North Carolina.

In the Elko County, Northeast Part area, summers are hot, especially at lower elevations, and the winters are cold. Precipitation is normally light at lower elevations during all months of the year, and the land is mainly used for livestock grazing. At higher elevations, precipitation is much greater and snow accumulates to considerable depths. Some of the snowmelt irrigates crops and hay in nearby valleys.

Table 1 gives data on temperature and precipitation for the survey area as recorded at

Montello and Wells in the period 1939 to 1971. Table 2 shows probable dates of the first freeze in fall and the last freeze in the spring. Table 3 provides data on length of growing season.

Growing degree days, shown in Table 1, are equivalent to "heat units". Beginning in the spring, growing degree days accumulate by the amount the average temperature exceeds a base temperature (40 degrees F°). The normal monthly accumulation is used to schedule single or successive plantings of a crop between the last freeze of spring and the first freeze of fall.

The total annual precipitation is 7 inches at Montello and 10 inches at Wells. Of this, 40 to 50 percent usually falls in April through September. The growing season for most crops falls within this period. Thunderstorms occur on about 20 days each year, and most occur in summer.

The average seasonal snowfall is 40 to 80 inches. On an average of 20 to 30 days, at least 1 inch of snow is on the ground. The number of such days varies greatly from year to year.

The average relative humidity in midafternoon is about 40 percent. Humidity is higher at night, and the average at dawn is about 70 percent. The sun shines 80 percent of the time in summer and 70 percent in winter. The prevailing wind is from the southwest. Average wind speed is highest, 7 miles per hour, in spring.

Detailed Soil Map Units

The map units on the detailed maps in Part III of this publication represent the soils or miscellaneous areas in the survey area. The map unit descriptions in this section, along with the maps, can be used to determine the suitability and potential of a unit for specific uses. They also can be used to plan the management needed for those uses. More information about each map unit is given under the headings "Use and Management of the Soils" and "Soil Properties."

A map unit delineation on the detailed soil maps represents an area dominated by one or more soils or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils or miscellaneous areas. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape however, the soils and miscellaneous areas are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, are mapped without including areas of other taxonomic classes. Consequently, map units are made up of the soils or miscellaneous areas for which they are named and some "included" areas that belong to other taxonomic classes.

Most included soils have properties and behavioral characteristics similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, inclusions. They may or may not be mentioned in the map unit description. Other included soils and miscellaneous areas, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, inclusions. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. The included areas of contrasting soils or miscellaneous areas are mentioned in the map unit descriptions. A few

included areas may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of included areas in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into segments that have similar use and management requirements. The delineation of such landscape segments on the map provides sufficient information for the development of resource plans, but if intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit. The principal hazards and limitations to be considered in planning for specific uses are identified in the tables and narrative in Part II.

Kinds of Map Units

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, wetness, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Some of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Devilsgait silt loam, 0 to 2 percent slopes, frequently flooded, is one of several phases in the Devilsgait series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are

associations. An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Donna-Stampede association is an example.

This survey includes *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Acreage and Extent

Table 4 gives the acreage and proportionate extent of each map unit. Other tables (see "Summary of Tables") give properties of the soils and the limitations, capabilities, and potentials for many uses. The Glossary defines many of the terms used in describing the soils or miscellaneous areas.

Headings and Introductory Phases

In the map unit descriptions that follow, a semitabular format is used. In this format the major headings are centered in the column (for example, *Composition*). They identify the information grouped directly below them. Introducing each item of information under the centered heading is a term or phrase (for example, *Major Components*) that identifies or describes the information. Many of the centered headings and introductory terms are self-explanatory; however, some of them need further explanation and are defined in the Glossary. Explanations of the headings and introductory phrases are provided in the following paragraphs, generally in the order in which they are used in the map unit descriptions.

Composition is given for the components (soils or miscellaneous areas) identified in the name of the map unit as well as for the contrasting inclusions.

Contrasting Inclusions are areas of components that differ sufficiently in use and management from the soils or miscellaneous areas for which the map unit is named. As was explained earlier, inclusions can either be *similar* or *contrasting*. Note that in the *Composition* section a single percentage is provided for a named soil and its similar inclusions because their use and management are similar.

Map Unit Setting is given for the entire map unit. This section gives the position on the landscape. The landscape positions given for the entire map unit

generally are broader than those given for each component. Below the map unit setting, the position of each component and inclusion is listed, and the physiographic location of each is identified.

Major Component Description lists the characteristics of the major components. These include elevation, texture of the surface layer, drainage class, parent material, and climatic data.

Dominant Present Vegetation lists the common plants growing on each soil at the present time. The present vegetation may be similar to the potential native plant community, but in some areas it consists of other plants, either cultivated or wild, that dominate the soils in the map unit.

Ecological Site is the assigned rangeland or grazed forest land ecological site that identifies a unique potential native plant community. The plant species and production typical of each ecological site are listed by map unit in the section "Rangeland Plants and Woodland Understory." Additional information about these sites is provided under the heading "Rangeland and Grazeable Woodland Resource Management" in Part II of this publication. Further information also can be obtained from the local office of the Natural Resources Conservation Service.

Map Unit Descriptions

010--Yuko-Akler association

Composition

Major Components

Yuko gravelly sandy loam, 15 to 50 percent slopes--55 percent

Akler loam, 8 to 15 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Wicup silty clay loam, 8 to 30 percent slopes--5 percent

Inclusion 2: Cotant gravelly clay loam, 15 to 50 percent slopes--4 percent

Inclusion 3: Lithic Torriorthents, loamy, mixed (calcareous), mesic very gravelly loam--1 percent

Map Unit Setting

Landscape position: Hills

Yuko--Landform: Hills; geomorphic position:

backslope; shape of slope: plane; aspect: south

Akler--Landform: Hills; geomorphic position: summit; shape of slope: plane

Inclusion 1--Landform: Hills; geomorphic position: backslope; aspect: north

Inclusion 2--Landform: Hills; geomorphic position: backslope; shape of slope: concave; aspect: east
 Inclusion 3--Landform: Hills; geomorphic position: backslope; position on slope: lower

Major Component Description

Yuko Series

Elevation: 5,900 to 6,300 feet
Precipitation: About 10 inches
Air temperature: About 45 degrees
Frost-free season: About 100 days
Surface rock fragments: 5 percent cobbles; 25 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Akler Series

Elevation: 5,900 to 6,300 feet
Precipitation: About 10 inches
Air temperature: About 45 degrees
Frost-free season: About 100 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

Yuko: Wyoming big sagebrush, basin wildrye, bluebunch wheatgrass
 Akler: Sandberg bluegrass, low sagebrush
 Inclusion 1: Sandberg bluegrass, Thurber needlegrass, big sagebrush
 Inclusion 2: Idaho fescue, low sagebrush
 Inclusion 3: Black sagebrush

Ecological Site

Yuko: 025XY015NV
 Akler: 025XY018NV
 Inclusion 1: 025XY014NV
 Inclusion 2: 025XY017NV
 Inclusion 3: 024XY030NV

020--Donna-Igdell-Vanwyper association

Composition

Major Components

Donna extremely cobbly clay loam, 4 to 15 percent slopes--55 percent

Igdell very gravelly clay loam, 4 to 15 percent slopes--15 percent
 Vanwyper very stony loam, 15 to 50 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Gochea loam, 2 to 4 percent slopes--4 percent
 Inclusion 2: Stampede gravelly loam, 4 to 15 percent slopes--4 percent
 Inclusion 3: Chen very cobbly loam, 4 to 15 percent slopes--4 percent
 Inclusion 4: Quarz very cobbly loam, 15 to 50 percent slopes--3 percent

Map Unit Setting

Landscape position: Hills and intermontane basins
 Donna--Landform: Fan remnants; geomorphic position: summit
 Igdell--Landform: Fan remnants; geomorphic position: summit; shape of slope: concave
 Vanwyper--Landform: Pediments; geomorphic position: backslope; aspect: south
 Inclusion 1--Landform: Fan remnants; geomorphic position: backslope; position on slope: lower
 Inclusion 2--Landform: Fan remnants; geomorphic position: summit
 Inclusion 3--Landform: Hills; geomorphic position: backslope; shape of slope: convex
 Inclusion 4--Landform: Hills; geomorphic position: backslope

Major Component Description

Donna Series

Elevation: 6,100 to 6,700 feet
Precipitation: About 11 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 20 percent cobbles; 40 percent gravel
Surface layer texture: Extremely cobbly clay loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Igdell Series

Elevation: 6,100 to 6,700 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 50 percent gravel
Surface layer texture: Very gravelly clay loam

Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Vanwyper Series

Elevation: 6,100 to 6,700 feet
Precipitation: About 10 inches
Air temperature: About 45 degrees
Frost-free season: About 100 days
Surface rock fragments: 10 percent cobbles
Surface layer texture: Very stony loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from quartzite

Dominant Present Vegetation

Donna: Sandberg bluegrass, low sagebrush
 Igdell: Idaho fescue, Sandberg bluegrass, low sagebrush
 Vanwyper: Wyoming big sagebrush, basin big sagebrush, basin wildrye, bluebunch wheatgrass
 Inclusion 1: Nevada bluegrass, Wyoming big sagebrush
 Inclusion 2: Nevada bluegrass, big sagebrush
 Inclusion 3: Idaho fescue, low sagebrush
 Inclusion 4: Basin wildrye, bluebunch wheatgrass

Ecological Site

Donna: 025XY022NV
 Igdell: 025XY017NV
 Vanwyper: 025XY015NV
 Inclusion 1: 025XY014NV
 Inclusion 2: 025XY014NV
 Inclusion 3: 025XY017NV
 Inclusion 4: 025XY009NV

021--Donna-Stampede association

Composition

Major Components

Donna gravelly loam, 2 to 8 percent slopes--65 percent
 Stampede gravelly loam, 2 to 8 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Elocin gravelly silt loam, 2 to 8 percent slopes--8 percent
 Inclusion 2: Durargidic Argixerolls, fine, montmorillonitic, frigid gravelly loam--6 percent
 Inclusion 3: Crooked Creek silty clay loam, drained, 0 to 2 percent slopes, rarely flooded--1 percent

Map Unit Setting

Landscape position: Fan piedmonts
 Donna--Landform: Fan remnants; geomorphic position: summit; position on slope: lower; shape of slope: concave
 Stampede--Landform: Fan remnants; geomorphic position: summit; position on slope: upper; shape of slope: convex
 Inclusion 1--Landform: Fan remnants; geomorphic position: backslope; position on slope: upper
 Inclusion 2--Landform: Fan remnants; geomorphic position: backslope
 Inclusion 3--Landform: Inset fans

Major Component Description

Donna Series

Elevation: 6,000 to 6,200 feet
Precipitation: About 11 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Stampede Series

Elevation: 6,000 to 6,200 feet
Precipitation: About 12 inches
Air temperature: About 43 degrees
Frost-free season: About 90 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Donna: Sandberg bluegrass, low sagebrush
 Stampede: Wyoming big sagebrush, bluebunch wheatgrass, cheatgrass
 Inclusion 1: Thurber needlegrass, low sagebrush
 Inclusion 2: Thurber needlegrass, low sagebrush
 Inclusion 3: Basin wildrye

Ecological Site

Donna: 025XY018NV
 Stampede: 025XY014NV
 Inclusion 1: 025XY018NV
 Inclusion 2: 025XY018NV
 Inclusion 3: 025XY003NV

022--Donna-Igdell-Donna, strongly sloping association**Composition****Major Components**

Donna gravelly loam, 2 to 8 percent slopes--40 percent

Igdell very gravelly clay loam, 2 to 8 percent slopes--30 percent

Donna gravelly loam, 8 to 15 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Stampede gravelly loam, 2 to 8 percent slopes--6 percent

Inclusion 2: Crooked Creek silty clay loam, 0 to 4 percent slopes, occasionally flooded--1 percent

Inclusion 3: Durargidic Argixerolls, clayey-skeletal, montmorillonitic, frigid gravelly loam--8 percent

Map Unit Setting

Inclusion 3--Landform: Fan remnants; geomorphic position: backslope; position on slope: upper; aspect: north

Inclusion 4--Landform: Drainageways

Major Component Description

Donna Series

Elevation: 6,200 to 6,500 feet

Precipitation: About 11 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 40 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Kleckner Series

Elevation: 6,200 to 6,500 feet

Precipitation: About 11 inches

Air temperature: About 43 degrees

Frost-free season: About 90 days

Surface rock fragments: 15 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks

Donna Series

Elevation: 6,200 to 6,500 feet

Precipitation: About 11 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 40 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Donna: Alkali sagebrush, bluebunch wheatgrass, low sagebrush

Kleckner: Thurber needlegrass, big sagebrush

Donna: Alkali sagebrush, bluebunch wheatgrass, low sagebrush

Inclusion 1: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Inclusion 2: Idaho fescue

Inclusion 3: Idaho fescue

Inclusion 4: Alpine timothy, mat muhly

Ecological Site

031--Welch-Crooked Creek association, wet

Composition

Major Components

Welch silt loam, 0 to 2 percent slopes, occasionally flooded--45 percent

Crooked Creek silty clay loam, gravelly substratum, 0 to 2 percent slopes, frequently flooded--40 percent

Contrasting Inclusions

Inclusion 1: Welch silt loam, 0 to 2 percent slopes, frequently flooded--5 percent

Inclusion 2: Welch silt loam, drained, 0 to 2 percent slopes, rarely flooded--5 percent

Inclusion 3: Crooked Creek silty clay loam, 0 to 2 percent slopes, occasionally flooded--5 percent

Map Unit Setting

Landscape position: Intermontane basins

Welch--Landform: Flood plains

Crooked Creek--Landform: Flood plains

Inclusion 1--Landform: Flood plains

Inclusion 2--Landform: Flood plains

Inclusion 3--Landform: Flood plains

Major Component Description

Welch Series

Elevation: 5,000 to 6,000 feet

Precipitation: About 14 inches

Air temperature: About 42 degrees

Frost-free season: About 90 days

Surface layer texture: Silt loam
Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Crooked Creek Series

Elevation: 5,000 to 6,000 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface layer texture: Silty clay loam
Drainage class: Poorly drained
Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Welch: Nevada bluegrass, alpine timothy
 Crooked Creek: Sedge
 Inclusion 1: Nevada bluegrass, tufted hairgrass, willow
 Inclusion 2: Basin big sagebrush, basin wildrye
 Inclusion 3: Nevada bluegrass, alpine timothy, willow

Ecological Site

Welch: 025XY006NV
 Crooked Creek: 025XY005NV
 Inclusion 1: 025XY005NV
 Inclusion 2: 025XY003NV
 Inclusion 3: 025XY006NV

032--Welch-Kelk association

Composition

Major Components

Welch silty clay loam, 0 to 2 percent slopes, frequently flooded--60 percent
 Kelk silt loam, 2 to 4 percent slopes, rarely flooded--30 percent

Contrasting Inclusions

Inclusion 1: Crooked Creek silty clay loam, 0 to 2 percent slopes, frequently flooded--5 percent
 Inclusion 2: Ocala silt loam, 0 to 2 percent slopes, occasionally flooded--5 percent

Map Unit Setting

Landscape position: Intermontane basins
 Welch--Landform: Flood plains
 Kelk--Landform: Inset fans
 Inclusion 1--Landform: Drainageways; shape of slope: concave
 Inclusion 2--Landform: Alluvial flats

Major Component Description

Welch Series

Elevation: 5,500 to 5,700 feet
Precipitation: About 9 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface layer texture: Silty clay loam
Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Kelk Series

Elevation: 5,500 to 5,700 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Welch: Nevada bluegrass, alpine timothy, sedge, tufted hairgrass
 Kelk: Basin big sagebrush, basin wildrye, inland saltgrass, rubber rabbitbrush
 Inclusion 1: Nevada bluegrass, willow
 Inclusion 2: Alkali sacaton, black greasewood

Ecological Site

Welch: 025XY005NV
 Kelk: 024XY006NV
 Inclusion 1: 025XY005NV
 Inclusion 2: 024XY007NV

034--Welch-Crooked Creek association, dry

Composition

Major Components

Welch loam, drained, 0 to 2 percent slopes, rarely flooded--65 percent
 Crooked Creek silty clay loam, drained, 0 to 2 percent slopes, rarely flooded--20 percent

Contrasting Inclusions

Inclusion 1: Welch silty clay loam, 0 to 2 percent slopes, frequently flooded--8 percent
 Inclusion 2: Welch silty clay loam, 0 to 2 percent slopes, occasionally flooded--5 percent
 Inclusion 3: Cumulic Haplaquolls, loamy-skeletal, mixed, frigid silt loam--2 percent

Map Unit Setting

Landscape position: Intermontane basins

Welch--Landform: Flood plains
 Crooked Creek--Landform: Flood plains
 Inclusion 1--Landform: Drainageways
 Inclusion 2--Landform: Flood plains
 Inclusion 3--Landform: Drainageways

Major Component Description

Welch Series

Elevation: 5,600 to 5,800 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface layer texture: Loam
Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Crooked Creek Series

Elevation: 5,600 to 5,800 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface layer texture: Silty clay loam
Drainage class: Poorly drained
Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Welch: Sandberg bluegrass, basin big sagebrush, basin wildrye
 Crooked Creek: Sandberg bluegrass, basin big sagebrush, basin wildrye
 Inclusion 1: Kentucky bluegrass, alpine timothy
 Inclusion 2: Nevada bluegrass, alpine timothy
 Inclusion 3: Sandberg bluegrass, basin wildrye

Ecological Site

Welch: 025XY003NV
 Crooked Creek: 025XY003NV
 Inclusion 1: 025XY005NV
 Inclusion 2: 025XY006NV
 Inclusion 3: 025XY003NV

035--Welch, drained-Welch-Gochea association

Composition

Major Components

Welch loam, drained, 0 to 2 percent slopes, 0 to 2 percent slopes--45 percent
 Welch loam, gravelly substratum, 0 to 2 percent slopes, frequently flooded--25 percent
 Gochea loam, 2 to 8 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Welch loam, gravelly substratum, 0 to 2 percent slopes, occasionally flooded--5 percent
 Inclusion 2: Durargidic Argixerolls, loamy-skeletal, mixed, frigid gravelly loam--5 percent
 Inclusion 3: Devilsgait silt loam, 0 to 2 percent slopes, frequently flooded--3 percent
 Inclusion 4: Riverwash--2 percent

Map Unit Setting

Landscape position: Intermontane basins
 Welch--Landform: Flood plains
 Welch--Landform: Flood plains
 Gochea--Landform: Stream terraces
 Inclusion 1--Landform: Flood plains
 Inclusion 2--Landform: Stream terraces
 Inclusion 3--Landform: Flood plains
 Inclusion 4--Landform: Drainageways

Major Component Description

Welch Series

Elevation: 5,600 to 6,200 feet
Precipitation: About 12 inches
Air temperature: About 42 degrees
Frost-free season: About 90 days
Surface layer texture: Loam
Drainage class: Somewhat poorly drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Welch Series

Elevation: 5,600 to 6,200 feet
Precipitation: About 12 inches
Air temperature: About 42 degrees
Frost-free season: About 90 days
Surface layer texture: Loam
Drainage class: Poorly drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Gochea Series

Elevation: 5,600 to 6,200 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Welch: Basin big sagebrush, rubber rabbitbrush, sedge

Welch: Timothy
 Gochea: Douglas rabbitbrush, Wyoming big sagebrush
 Inclusion 1: Nevada bluegrass
 Inclusion 2: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
 Inclusion 3: Creeping wildrye, willow
 Inclusion 4: None

Ecological Site

Welch: 025XY003NV
 Welch: 025XY005NV
 Gochea: 025XY014NV

 Inclusion 2: 025XY014NV
 Inclusion 3: 025XY001NV
 Inclusion 4: none

040--Mclvey-Quarz association

Composition

Major Components

Mclvey gravelly loam, 30 to 50 percent slopes--50 percent
 Quarz very gravelly loam, 15 to 50 percent slopes--40 percent

Contrasting Inclusions

Inclusion 1: Mclvey gravelly silt loam, 4 to 15 percent slopes--5 percent
 Inclusion 2: Chen very gravelly loam, 15 to 30 percent slopes--4 percent
 Inclusion 3: Crooked Creek silty clay, 0 to 2 percent slopes, frequently flooded--1 percent

Map Unit Setting

Landscape position: Mountains and foothills
 Mclvey--Landform: Hills; geomorphic position: backslope; aspect: north
 Quarz--Landform: Hills; geomorphic position: backslope; aspect: south
 Inclusion 1--Landform: Mountains; geomorphic position: backslope; position on slope: lower
 Inclusion 2--Landform: Mountains; geomorphic position: summit
 Inclusion 3--Landform: Drainageways

Major Component Description

Mclvey Series

Elevation: 6,200 to 7,100 feet
Precipitation: About 14 inches
Air temperature: About 43 degrees
Frost-free season: About 90 days

Surface rock fragments: 25 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from sedimentary rocks

Quarz Series

Elevation: 6,200 to 7,100 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 45 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Dominant Present Vegetation

Mclvey: Idaho fescue, mountain big sagebrush, serviceberry, snowberry
 Quarz: Bluebunch wheatgrass
 Inclusion 1: Antelope bitterbrush
 Inclusion 2: Low sagebrush
 Inclusion 3: Alpine timothy

Ecological Site

Mclvey: 025XY012NV
 Quarz: 025XY009NV
 Inclusion 1: 025XY012NV
 Inclusion 2: 025XY017NV
 Inclusion 3: 025XY005NV

060--Coser-Arva-Lerrow association

Composition

Major Components

Coser gravelly clay loam, 4 to 15 percent slopes--40 percent
 Arva gravelly loam, 8 to 30 percent slopes--25 percent
 Lerrow gravelly loam, 30 to 50 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Xerollic Paleargids, very-fine, montmorillonitic, frigid silt loam--5 percent
 Inclusion 2: Lerrow gravelly loam, 4 to 15 percent slopes--5 percent
 Inclusion 3: Quarz gravelly loam, 30 to 50 percent slopes--3 percent
 Inclusion 4: Mclvey very gravelly loam, 15 to 30 percent slopes--2 percent

Map Unit Setting

Landscape position: Hills

Coser--Landform: Hills; geomorphic position: summit

Arva--Landform: Hills; geomorphic position:
backslope; shape of slope: concave

backslope; position on slope: lower; shape of
slope: concave

Inclusion 3--Landform: Hills; geomorphic position:
backslope; shape of slope: convex; aspect: south

Inclusion 4--Landform: Hills; geomorphic position:
backslope; shape of slope: concave; aspect:
north

Major Component Description**Coser Series**

Elevation: 6,200 to 6,900 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 70 percent gravel

Surface layer texture: Gravelly clay loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium
derived from sedimentary rocks

Arva Series

Elevation: 6,200 to 6,900 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 80 days

Surface rock fragments: 25 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Alluvium and colluvium
derived from sedimentary rocks

Lerrow Series

Elevation: 6,200 to 6,900 feet

Precipitation: About 12 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 35 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium
derived from volcanic rocks

Dominant Present Vegetation

Coser: Idaho fescue, low sagebrush

Arva: Idaho fescue, basin big sagebrush, bluebunch
wheatgrass

Lerrow: Basin wildrye, bluebunch wheatgrass,
mountain big sagebrush

Inclusion 1: Bluebunch wheatgrass, low sagebrush

Inclusion 2: Basin big sagebrush, bluebunch
wheatgrass

Inclusion 3: Antelope bitterbrush

Inclusion 4: Idaho fescue, antelope bitterbrush

Major Component Description

Wieland Series

Elevation: 5,800 to 6,100 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface rock fragments: 20 percent gravel

Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Nevador Series

Elevation: 5,800 to 6,100 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 115 days
Surface layer texture: Loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Donna Series

Elevation: 6,000 to 6,400 feet
Precipitation: About 11 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Wieland: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail
 Nevador: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail
 Donna: Low sagebrush
 Inclusion 1: Thurber needlegrass, Wyoming big sagebrush, basin wildrye
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 3: Wyoming big sagebrush, bluebunch wheatgrass

127--Peeko-Chiara association

Composition

Major Components

Peeko silt loam, 2 to 8 percent slopes--50 percent
 Chiara silt loam, 2 to 8 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Zapa very gravelly silt loam, 15 to 30 percent slopes--5 percent
 Inclusion 2: Wiffo very gravelly loam, 2 to 4 percent slopes--5 percent
 Inclusion 3: Xerollic Durorthids, fine-loamy, mixed, mesic gravelly silt loam--4 percent
 Inclusion 4: Hundraw gravelly fine sandy loam, 8 to 30 percent slopes--1 percent

Map Unit Setting

Landscape position: Fan piedmonts
 Peeko--Landform: Fan remnants; geomorphic position: summit; shape of slope: plane
 Chiara--Landform: Fan remnants; geomorphic

position: summit; shape of slope: concave
 Inclusion 1--Landform: Fan remnants; geomorphic
 position: backslope; shape of slope: concave
 Inclusion 2--Landform: Inset fans
 Inclusion 3--Landform: Fan remnants; geomorphic
 position: summit; shape of slope: concave
 Inclusion 4--Landform: Pediments; geomorphic
 position: backslope; position on slope: upper

Major Component Description

Peeko Series

Elevation: 5,700 to 6,600 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from
 mixed rocks, loess and volcanic ash

Chiara Series

Elevation: 5,700 to 6,600 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 15 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from
 mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Peeko: Indian ricegrass, black sagebrush,
 bottlebrush squirreltail, cheatgrass
 Chiara: Sandberg bluegrass, Wyoming big
 sagebrush, bottlebrush squirreltail, cheatgrass
 Inclusion 1: Indian ricegrass, Thurber needlegrass,
 black sagebrush
 Inclusion 2: Thurber needlegrass, Wyoming big
 sagebrush, basin wildrye
 Inclusion 3: Thurber needlegrass, black sagebrush,
 bluebunch wheatgrass
 Inclusion 4: Utah juniper, black sagebrush

Ecological Site

Peeko: 024XY030NV
 Chiara: 025XY019NV
 Inclusion 1: 024XY030NV
 Inclusion 2: 025XY019NV
 Inclusion 3: 024XY031NV
 Inclusion 4: 025XY060NV

129--Dewar-Chuska association

Composition

Major Components

Dewar gravelly silt loam, 2 to 8 percent slopes--45
 percent
 Chuska gravelly loam, 2 to 8 percent slopes--40
 percent

Contrasting Inclusions

Inclusion 1: Nevador loam, 4 to 15 percent slopes--
 10 percent
 Inclusion 2: Dewar gravelly silt loam, 4 to 15
 percent slopes--5 percent

Map Unit Setting

Landscape position: Fan piedmonts
 Dewar--Landform: Fan remnants; geomorphic
 position: summit
 Chuska--Landform: Fan remnants; geomorphic
 position: summit
 Inclusion 1--Landform: Fan remnants; geomorphic

 of slope: convex
 Inclusion 2--Landform: Fan remnants; geomorphic
 position: summit; position on slope: upper; shape
 of slope: plane

Major Component Description

Dewar Series

Elevation: 5,000 to 6,000 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Gravelly silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from
 mixed rocks, loess and volcanic ash

Chuska Series

Elevation: 5,000 to 6,000 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface rock fragments: 1 percent cobbles; 10
 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from
 volcanic rocks

Dominant Present Vegetation

Dewar: Wyoming big sagebrush

Chuska: Sandberg bluegrass, Wyoming big sagebrush
 Inclusion 1: Thurber needlegrass, Wyoming big sagebrush, basin wildrye
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush

Ecological Site

Dewar: 025XY019NV
 Chuska: 025XY019NV
 Inclusion 1: 025XY019NV
 Inclusion 2: 025XY019NV

130--Dewar-Wieland-Bilbo association

Composition

Major Components

Dewar gravelly silt loam, 2 to 4 percent slopes--40 percent
 Wieland loam, 4 to 15 percent slopes--35 percent
 Bilbo very gravelly sandy clay loam, 30 to 50 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Hunnton gravelly loam, 4 to 15 percent slopes--9 percent
 Inclusion 2: Cumulic Haploxerolls, loamy-skeletal, mixed, frigid silt loam--1 percent

Map Unit Setting

Landscape position: Fan piedmonts
 Dewar--Landform: Fan remnants; geomorphic position: summit
 Wieland--Landform: Fan remnants; geomorphic position: backslope; shape of slope: plane
 Bilbo--Landform: Fan remnants; geomorphic position: backslope; aspect: south
 Inclusion 1--Landform: Fan remnants; geomorphic position: backslope; position on slope: upper; shape of slope: convex
 Inclusion 2--Landform: Inset fans

Major Component Description

Dewar Series

Elevation: 5,800 to 6,100 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Gravelly silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Wieland Series

Elevation: 5,800 to 6,100 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Bilbo Series

Elevation: 5,800 to 6,100 feet
Precipitation: About 10 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 30 percent cobbles; 30 percent gravel
Surface layer texture: Very gravelly sandy clay loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Dewar: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail, cheatgrass
 Wieland: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail, cheatgrass
 Bilbo: Sandberg bluegrass, Wyoming big sagebrush
 Inclusion 1: Thurber needlegrass, Wyoming big sagebrush, basin wildrye
 Inclusion 2: Basin wildrye

140--Chiara-Wieland-Enko association***Composition*****Major Components**

Chiara silt loam, 2 to 4 percent slopes--40 percent
 Wieland loam, 2 to 8 percent slopes--30 percent
 Enko fine sandy loam, 2 to 8 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Hunnton silt loam, 2 to 4 percent slopes--5 percent
 Inclusion 2: Nevador very gravelly loam, 15 to 30 percent slopes--3 percent
 Inclusion 3: Kelk silt loam, 0 to 2 percent slopes, rarely flooded--2 percent

Map Unit Setting

Landscape position: Hills and intermontane basins
 Chiara--Landform: Fan remnants; geomorphic position: summit; position on slope: upper; shape of slope: convex
 Wieland--Landform: Fan remnants; geomorphic position: backslope; position on slope: lower
 Enko--Landform: Inset fans
 Inclusion 1--Landform: Fan remnants; geomorphic position: summit; shape of slope: concave
 Inclusion 2--Landform: Fan remnants; geomorphic position: backslope; shape of slope: concave

Inclusion 3--Landform: Inset fans

Major Component Description**Chiara Series**

Elevation: 5,500 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 15 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Wieland Series

Elevation: 5,500 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Enko Series

Elevation: 5,500 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface rock fragments: 2 percent gravel
Surface layer texture: Fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Chiara: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail
 Wieland: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail, cheatgrass
 Enko: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail
 Inclusion 1: Thurber needlegrass, Wyoming big sagebrush, basin wildrye
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush, basin wildrye
 Inclusion 3: Basin big sagebrush, basin wildrye, bottlebrush squirreltail

Ecological Site

Chiara: 025XY019NV
 Wieland: 025XY019NV
 Enko: 025XY019NV

Inclusion 1: 025XY019NV
 Inclusion 2: 025XY019NV
 Inclusion 3: 024XY006NV

141--Chiara-Kelk-Kelk, rarely flooded association

Composition

Major Components

Chiara silt loam, 2 to 4 percent slopes--50 percent
 Kelk silt loam, 2 to 8 percent slopes--20 percent
 Kelk silt loam, 0 to 2 percent slopes, rarely flooded--15 percent

Contrasting Inclusions

Inclusion 1: Puett gravelly sandy loam, 8 to 30 percent slopes--10 percent
 Inclusion 2: Xerollic Camborthids, sandy-skeletal, mixed, mesic sandy loam--3 percent
 Inclusion 3: Dacker silt loam, 2 to 4 percent slopes--2 percent

Map Unit Setting

Landscape position: Fan piedmonts
 Chiara--Landform: Fan remnants; geomorphic position: summit; shape of slope: plane
 Kelk--Landform: Fan skirts
 Kelk--Landform: Inset fans
 Inclusion 1--Landform: Pediments; geomorphic position: backslope
 Inclusion 2--Landform: Fan remnants; geomorphic position: backslope; shape of slope: convex
 Inclusion 3--Landform: Fan remnants; geomorphic position: summit; shape of slope: concave

Major Component Description

Chiara Series

Elevation: 5,400 to 5,700 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 15 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Kelk Series

Elevation: 5,400 to 5,700 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Kelk Series

Elevation: 5,400 to 5,700 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Chiara: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail, cheatgrass
 Kelk: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail
 Kelk: Basin big sagebrush, basin wildrye, bottlebrush squirreltail
 Inclusion 1: Indian ricegrass, black sagebrush
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 3: Thurber needlegrass, Wyoming big sagebrush

Ecological Site

Chiara: 025XY019NV

 Inclusion 2--Landform: Inset fans
 Inclusion 3--Landform: Fan remnants; geomorphic position: backslope

Major Component Description

Chiara Series

Elevation: 5,600 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 15 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dewar Series

Elevation: 5,600 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Gravelly silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Enko Series

Elevation: 5,600 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface rock fragments: 2 percent gravel
Surface layer texture: Fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Chiara: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail
 Dewar: Wyoming big sagebrush
 Enko: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail
 Inclusion 1: Thurber needlegrass, Wyoming big sagebrush, basin wildrye

Inclusion 2: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 3: Thurber needlegrass, Wyoming big sagebrush

Ecological Site

Chiara: 025XY019NV

 Inclusion 3: 025XY019NV

150--Shalper-Tusel-Shalclev association

Composition

Major Components

Shalper very gravelly loam, 15 to 30 percent slopes--55 percent
 Tusel very gravelly fine sandy loam, 30 to 50 percent slopes--15 percent
 Shalclev extremely gravelly silt loam, 4 to 15 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Durargidic Argixerolls, loamy, mixed, frigid, shallow gravelly loam--5 percent
 Inclusion 2: Tweener very gravelly loam, 15 to 30 percent slopes--4 percent
 Inclusion 3: Quarz gravelly loam, 30 to 50 percent slopes--4 percent
 Inclusion 4: Rock outcrop--2 percent

Map Unit Setting

Landscape position: Hills

Shalper--Landform: Hills; geomorphic position: summit; shape of slope: plane
 Tusel--Landform: Hills; geomorphic position: backslope; shape of slope: plane; aspect: north
 Shalclev--Landform: Hills; geomorphic position: summit; position on slope: upper
 Inclusion 1--Landform: Hills; geomorphic position: backslope; position on slope: lower; shape of slope: plane
 Inclusion 2--Landform: Hills; geomorphic position: backslope; shape of slope: convex; aspect: north
 Inclusion 3--Landform: Hills; geomorphic position: backslope; shape of slope: plane; aspect: south
 Inclusion 4--Landform: Hills

Major Component Description

Shalper Series

Elevation: 6,300 to 6,700 feet
Precipitation: About 10 inches

Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Tusel Series

Elevation: 6,300 to 6,700 feet
Precipitation: About 17 inches
Air temperature: About 43 degrees
Frost-free season: About 65 days
Surface rock fragments: 35 percent cobbles; 15 percent gravel
Surface layer texture: Very gravelly fine sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from mixed rocks, loess and volcanic ash

Shalcleav Series

Elevation: 6,300 to 6,700 feet
Precipitation: About 16 inches
Air temperature: About 44 degrees
Frost-free season: About 70 days
Surface rock fragments: 5 percent cobbles; 60 percent gravel
Surface layer texture: Extremely gravelly silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Shalper: Bluebunch wheatgrass, cheatgrass
 Tusel: Mountain brome, slender wheatgrass, snowberry
 Shalcleav: Indian ricegrass, Sandberg bluegrass, Thurber needlegrass, black sagebrush
 Inclusion 1: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
 Inclusion 2: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 3: Antelope bitterbrush, bluebunch wheatgrass
 Inclusion 4: None

Ecological Site

Shalper: 025XY021NV
 Tusel: 025XY004NV
 Shalcleav: 025XY057NV
 Inclusion 1: 025XY014NV
 Inclusion 2: 025XY007NV
 Inclusion 3: 025XY009NV
 Inclusion 4: none

151--Shalper-Soughe association

Composition

Major Components

Shalper very gravelly loam, 4 to 30 percent slopes--70 percent
 Soughe very gravelly coarse sandy loam, 15 to 50 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Rodie very gravelly loam, 15 to 50 percent slopes--5 percent
 Inclusion 2: Typic Haploxerolls, loamy, mixed, frigid, shallow very gravelly loam--5 percent
 Inclusion 3: Cameek gravelly loam, 2 to 8 percent slopes--3 percent
 Inclusion 4: Shalcleav extremely gravelly silt loam, 4 to 15 percent slopes--2 percent

Map Unit Setting

Landscape position: Hills
 Shalper--Landform: Hills; geomorphic position: summit; shape of slope: plane
 Soughe--Landform: Hills; geomorphic position: backslope; shape of slope: plane; aspect: south
 Inclusion 1--Landform: Hills; geomorphic position: backslope; shape of slope: plane; aspect: north
 Inclusion 2--Landform: Hills; geomorphic position: backslope; shape of slope: concave; aspect: north
 Inclusion 3--Landform: Hills; geomorphic position: backslope; position on slope: lower; shape of slope: concave
 Inclusion 4--Landform: Hills; geomorphic position: summit

Major Component Description

Shalper Series

Elevation: 5,600 to 6,300 feet
Precipitation: About 10 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Soughe Series

Elevation: 5,600 to 6,300 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 5 percent cobbles; 35 percent gravel

Surface layer texture: Very gravelly coarse sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Shalper: Bottlebrush squirreltail, cheatgrass

Soughe: Sandberg bluegrass, Wyoming big sagebrush, cheatgrass

Inclusion 1: Black sagebrush, bluebunch wheatgrass

Inclusion 2: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Inclusion 3: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Inclusion 4: Thurber needlegrass, black sagebrush

Ecological Site

Inclusion 2: 025XY014NV

Inclusion 3: 025XY014NV

Inclusion 4: 025XY057NV

154--Shalper-Contact-Rock outcrop association

Composition

Major Components

Shalper very gravelly sandy loam, 15 to 30 percent slopes--35 percent

Contact gravelly loamy coarse sand, 15 to 30 percent slopes--30 percent

Rock outcrop--15 percent

Contrasting Inclusions

Inclusion 1: Lithic Xeric Torriorthents, sandy-skeletal, mixed, mesic very gravelly loam--10 percent

Inclusion 2: Xica gravelly loamy coarse sand, 4 to 15 percent slopes--8 percent

Inclusion 3: Valmy very fine sandy loam, 4 to 15 percent slopes--1 percent

Inclusion 4: Aridic Argixerolls, coarse-loamy, mixed, mesic gravelly loam--1 percent

Map Unit Setting

Landscape position: Hills

Shalper--Landform: Hills; geomorphic position: backslope; shape of slope: convex

Contact--Landform: Hills; geomorphic position: backslope; shape of slope: concave

Rock outcrop--Landform: Hills; geomorphic position: summit

Inclusion 1--Landform: Hills; geomorphic position: backslope

Inclusion 2--Landform: Hills; geomorphic position: summit; position on slope: upper

Inclusion 3--Landform: Alluvial fans

Inclusion 4--Landform: Hills; geomorphic position: backslope; aspect: south

Major Component Description

Shalper Series

Elevation: 5,400 to 6,000 feet

Precipitation: About 10 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 40 percent gravel

Surface layer texture: Very gravelly sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from granitic rocks

Contact Series

Elevation: 5,400 to 6,000 feet

Precipitation: About 11 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 30 percent gravel

Surface layer texture: Gravelly loamy coarse sand

Drainage class: Somewhat excessively drained

Dominant parent material: Colluvium derived from granitic rocks

Rock outcrop Miscellaneous Area

Elevation: 5,400 to 6,000 feet

Dominant Present Vegetation

Shalper: Wyoming big sagebrush, bluebunch wheatgrass

Contact: Thurber needlegrass, basin big sagebrush, bluebunch wheatgrass

Rock outcrop: None

Inclusion 1: Antelope bitterbrush

Inclusion 2: Sandberg bluegrass, Thurber needlegrass, black sagebrush

Inclusion 3: Basin wildrye, big sagebrush, black greasewood

Inclusion 4: Wyoming big sagebrush, bluebunch wheatgrass

Ecological Site

Shalper: 025XY021NV

Contact: 025XY014NV

Rock outcrop: None

Inclusion 1: 025XY058NV
 Inclusion 2: 025XY057NV
 Inclusion 3: 024XY022NV
 Inclusion 4: 025XY015NV

155--Shalper-Rock outcrop-Pequop association

Composition

Major Components

Shalper very gravelly sandy loam, 8 to 30 percent slopes--40 percent
 Rock outcrop--25 percent
 Pequop gravelly loam, 8 to 30 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Lithic Xeric Torriorthents, sandy-skeletal, mixed, mesic very gravelly loam--10 percent
 Inclusion 2: Typic Argixerolls, loamy, mixed, frigid, shallow very gravelly loam--5 percent
 Inclusion 3: Typic Argixerolls, fine-loamy, mixed, frigid gravelly loam--5 percent

Map Unit Setting

Landscape position: Hills
 Shalper--Landform: Hills; geomorphic position: backslope; position on slope: upper; shape of slope: convex
 Rock outcrop--Landform: Hills; geomorphic position: summit
 Pequop--Landform: Hills; geomorphic position: backslope; position on slope: lower; shape of slope: concave
 Inclusion 1--Landform: Hills
 Inclusion 2--Landform: Hills; geomorphic position: summit; shape of slope: convex
 Inclusion 3--Landform: Hills; geomorphic position: backslope; position on slope: lower; shape of slope: concave

Major Component Description

Shalper Series

Elevation: 5,500 to 7,300 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from granitic rocks

Rock outcrop Miscellaneous Area

Elevation: 5,500 to 7,300 feet

Pequop Series

Elevation: 5,500 to 7,300 feet
Precipitation: About 14 inches
Air temperature: About 43 degrees
Frost-free season: About 85 days
Surface rock fragments: 5 percent cobbles; 35 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from granitic rocks

Dominant Present Vegetation

Shalper: Wyoming big sagebrush, bluebunch wheatgrass, cheatgrass
 Rock outcrop: None
 Pequop: Idaho fescue, antelope bitterbrush
 Inclusion 1: Bluebunch wheatgrass
 Inclusion 2: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Inclusion 3: Basin big sagebrush, bluebunch wheatgrass

Ecological Site

Shalper: 025XY021NV
 Pequop: 025XY012NV
 Rock outcrop: None
 Inclusion 1: 025XY058NV
 Inclusion 2: 025XY017NV
 Inclusion 3: 025XY027NV

156--Shalper-Dewar-Yuko association

Composition

Major Components

Shalper very gravelly loam, 4 to 15 percent slopes--55 percent
 Dewar gravelly silt loam, 2 to 8 percent slopes--15 percent
 Yuko gravelly sandy loam, 15 to 30 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Typic Argixerolls, fine-loamy, mixed, frigid gravelly loam--8 percent
 Inclusion 2: Xeric Torriorthents, loamy, mixed (calcareous), frigid, shallow gravelly silt loam--4 percent
 Inclusion 3: Durargidic Argixerolls, coarse-loamy, mixed, mesic gravelly loam--3 percent

Map Unit Setting

Landscape position: Hills and intermontane basins
 Shalper--Landform: Hills; geomorphic position: backslope; position on slope: lower
 Dewar--Landform: Fan remnants; geomorphic position: summit
 Yuko--Landform: Hills; geomorphic position: backslope; aspect: south
 Inclusion 1--Landform: Hills; geomorphic position: backslope; position on slope: upper; aspect: north
 Inclusion 2--Landform: Hills; geomorphic position: backslope; position on slope: upper; aspect: south
 Inclusion 3--Landform: Drainageways

Major Component Description**Shalper Series**

Elevation: 5,700 to 6,600 feet
Precipitation: About 10 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dewar Series

Elevation: 5,700 to 6,600 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Gravelly silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Yuko Series

Elevation: 5,700 to 6,600 feet
Precipitation: About 10 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 5 percent cobbles; 25 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dominant Present Vegetation

Shalper: Wyoming big sagebrush, bluebunch wheatgrass

Dewar: Sandberg bluegrass, Wyoming big sagebrush, basin big sagebrush
 Yuko: Wyoming big sagebrush, basin big sagebrush, bluebunch wheatgrass
 Inclusion 1: Basin big sagebrush, bluebunch wheatgrass
 Inclusion 2: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 3: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Ecological Site

Shalper: 025XY021NV

Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Chiara Series

Elevation: 5,900 to 6,200 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 15 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Peeko Series

Elevation: 5,900 to 6,200 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Dacker: Wyoming big sagebrush, bottlebrush squirreltail, cheatgrass
 Chiara: Wyoming big sagebrush, bottlebrush squirreltail, cheatgrass
 Peeko: Indian ricegrass, black sagebrush, bluegrass, bottlebrush squirreltail
 Inclusion 1: Indian ricegrass, Thurber needlegrass, black sagebrush
 Inclusion 2: Indian ricegrass, Thurber needlegrass, black sagebrush
 Inclusion 3: Thurber needlegrass, Wyoming big sagebrush, basin wildrye

Inclusion 4: Thurber needlegrass, Wyoming big sagebrush

Ecological Site

Dacker: 025XY019NV

 Inclusion 2--Landform: Partial ballenas; geomorphic position: summit
 Inclusion 3--Landform: Partial ballenas; geomorphic position: backslope

Major Component Description

Enko Series

Elevation: 5,500 to 5,600 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Kelk Series

Elevation: 5,500 to 5,600 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Enko Series

Elevation: 5,500 to 5,600 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Very fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Enko: Sandberg bluegrass, Wyoming big sagebrush, cheatgrass
 Kelk: Sandberg bluegrass, Wyoming big sagebrush, cheatgrass
 Enko: Sandberg bluegrass, Wyoming big sagebrush, cheatgrass

Air temperature: About 42 degrees

Frost-free season: About 85 days

Surface rock fragments: 25 percent gravel

Surface layer texture: Gravelly silty clay loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from pyroclastic and extrusive volcanic rocks

Chayson Series

Elevation: 5,800 to 6,200 feet

Precipitation: About 14 inches

Air temperature: About 43 degrees

Frost-free season: About 100 days

Surface layer texture: Loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from volcanic rocks, loess and volcanic ash

Igdell Series

Elevation: 5,800 to 6,200 feet

Precipitation: About 12 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 55 percent gravel

Surface layer texture: Very gravelly clay loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Forvic: Basin big sagebrush, bluebunch wheatgrass

Chayson: Basin big sagebrush, bluebunch wheatgrass

Igdell: Idaho fescue, bluebunch wheatgrass, low sagebrush

Inclusion 1: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Inclusion 2: Nevada bluegrass, willow

Ecological Site

Forvic: 025XY027NV

Chayson: 025XY027NV

Igdell: 025XY017NV

Inclusion 1: 025XY009NV

Inclusion 2: 025XY005NV

195--Chayson-Igdell association**Composition****Major Components**

Chayson loam, 4 to 15 percent slopes--60 percent

Igdell very gravelly clay loam, 4 to 15 percent slopes--30 percent

Contrasting Inclusions

Inclusion 1: Crooked Creek silty clay loam, drained, 0 to 2 percent slopes, rarely flooded--5 percent

Inclusion 2: Crooked Creek silt loam, 0 to 2 percent slopes, frequently flooded--2 percent

Inclusion 3: Arva silt loam, 15 to 50 percent slopes--2 percent

Inclusion 4: Typic Argixerolls, fine, montmorillonitic, frigid gravelly loam--1 percent

Map Unit Setting

Landscape position: Fan piedmonts

Chayson--Landform: Fan remnants; geomorphic position: summit; shape of slope: concave

Igdell--Landform: Fan remnants; geomorphic position: summit; shape of slope: convex

Inclusion 1--Landform: Drainageways

Inclusion 2--Landform: Drainageways

Inclusion 3--Landform: Fan remnants; geomorphic position: backslope; shape of slope: concave; aspect: north

Inclusion 4--Landform: Fan remnants; geomorphic position: backslope

Major Component Description**Chayson Series**

Elevation: 5,800 to 6,200 feet

Precipitation: About 14 inches

Air temperature: About 43 degrees

Frost-free season: About 100 days

Surface layer texture: Loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from volcanic rocks, loess and volcanic ash

Igdell Series

Elevation: 5,800 to 6,200 feet

Precipitation: About 12 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 55 percent gravel

Surface layer texture: Very gravelly clay loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Chayson: Idaho fescue, Sandberg bluegrass, basin big sagebrush, bluebunch wheatgrass

Igdell: Idaho fescue, Sandberg bluegrass, bluebunch wheatgrass, low sagebrush

Inclusion 1: Nevada bluegrass, basin wildrye

Inclusion 2: Nevada bluegrass, willow

Inclusion 3: Idaho fescue

Inclusion 4: Idaho fescue, bluebunch wheatgrass, low sagebrush

Ecological Site

Major Component Description

Shalclev Series

Elevation: 6,800 to 8,200 feet
Precipitation: About 16 inches
Air temperature: About 44 degrees
Frost-free season: About 80 days
Surface rock fragments: 5 percent cobbles; 60 percent gravel
Surface layer texture: Extremely gravelly silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Gollaher Series

Elevation: 6,800 to 8,200 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 80 days
Surface rock fragments: 5 percent cobbles; 50 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Hapgood Series

Elevation: 6,800 to 8,200 feet

Precipitation: About 16 inches

Air temperature: About 42 degrees

Frost-free season: About 70 days

Surface rock fragments: 40 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Colluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Shalclev: Idaho fescue, black sagebrush, bluebunch wheatgrass

Gollaher: Idaho fescue, black sagebrush, bluebunch wheatgrass

Hapgood: California brome, Idaho fescue, mountain big sagebrush, snowberry

Inclusion 1: Mountain brome, quaking aspen

Inclusion 2: Idaho fescue, bluebunch wheatgrass, low sagebrush

Inclusion 3: Idaho fescue, antelope bitterbrush, mountain big sagebrush

Inclusion 4: Letterman needlegrass

Ecological Site

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Rodie Series

Elevation: 5,800 to 6,800 feet

Precipitation: About 13 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 5 percent cobbles; 55 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Colluvium derived from pyroclastic and extrusive volcanic rocks

Dominant Present Vegetation

Shalcleav: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Quopant: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Rodie: Sandberg bluegrass, Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Inclusion 1: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Inclusion 2: Thurber needlegrass, bluebunch wheatgrass
 Inclusion 3: None
 Inclusion 4: None

Ecological Site

Shalcleav: 025XY057NV
 Quopant: 024XY031NV
 Rodie: 025XY055NV
 Inclusion 1: 025XY009NV
 Inclusion 2: 025XY014NV
 Inclusion 3: none
 Inclusion 4: none

227--Shalcleav, steep-Shalcleav-Rodie association

Composition

Major Components

Shalcleav extremely gravelly silt loam, 15 to 50 percent slopes--50 percent
 Shalcleav extremely gravelly silt loam, 4 to 15 percent slopes--20 percent
 Rodie very gravelly loam, 15 to 50 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Hapgood gravelly loam, 15 to 50 percent slopes--5 percent
 Inclusion 2: Typic Argixerolls, fine, montmorillonitic, frigid gravelly loam--4 percent
 Inclusion 3: Aridic Durixerolls, loamy-skeletal, mixed, frigid, shallow very gravelly loam--4 percent
 Inclusion 4: Shalper gravelly loam, 15 to 50 percent slopes--2 percent

Map Unit Setting

Landscape position: Hills

Shalcleav--Landform: Hills; geomorphic position: backslope; shape of slope: convex

Inclusion 4--Landform: Hills; geomorphic position: backslope; position on slope: upper; shape of slope: concave

Major Component Description**Gumble Series**

Elevation: 5,700 to 6,300 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 30 percent gravel

Surface layer texture: Gravelly sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Shalper Series

Elevation: 5,700 to 6,300 feet

Precipitation: About 10 inches

Air temperature: About 44 degrees

Frost-free season: About 100 days

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Izar Series

Elevation: 5,700 to 6,300 feet

Precipitation: About 9 inches

Air temperature: About 46 degrees

Frost-free season: About 110 days

Surface rock fragments: 60 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Somewhat excessively drained

Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Dominant Present Vegetation

Gumble: Wyoming big sagebrush, bluebunch wheatgrass

Shalper: Thurber needlegrass, Wyoming big sagebrush, bluebunch wheatgrass

Izar: Indian ricegrass, black sagebrush

Inclusion 1: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Inclusion 2: Utah juniper, black sagebrush

250--Chuska-Chuska, strongly sloping-Soughe association**Composition****Major Components**

Chuska gravelly loam, 2 to 8 percent slopes--50 percent

Chuska gravelly loam, 8 to 15 percent slopes--25 percent

Soughe very gravelly coarse sandy loam, 15 to 30 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Lithic Xeric Torriorthents, loamy, mixed (calcareous), mesic very gravelly loam--5 percent

Inclusion 2: Xerollic Camborthids, coarse-loamy, mixed, mesic silt loam--4 percent

Inclusion 3: Cumulic Haplaquolls, coarse-loamy, mixed, mesic--1 percent

Map Unit Setting

Landscape position: Fan piedmonts

Chuska--Landform: Fan remnants; geomorphic position: summit; position on slope: upper; shape of slope: convex

Chuska--Landform: Fan remnants; geomorphic position: backslope; position on slope: lower

Soughe--Landform: Pediments; geomorphic position: backslope; aspect: south

Inclusion 1--Landform: Fan remnants; geomorphic position: backslope; shape of slope: convex

Inclusion 2--Landform: Fan remnants; geomorphic position: backslope; shape of slope: concave

Inclusion 3--Landform: Drainageways

Major Component Description**Chuska Series**

Elevation: 5,200 to 5,600 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 100 days

Surface rock fragments: 1 percent cobbles; 10 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from volcanic rocks

Chuska Series

Elevation: 5,200 to 5,600 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 100 days
Surface rock fragments: 1 percent cobbles; 10 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from volcanic rocks

Soughe Series

Elevation: 5,200 to 5,600 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 5 percent cobbles; 35 percent gravel
Surface layer texture: Very gravelly coarse sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Chuska: Sandberg bluegrass, Wyoming big sagebrush
 Chuska: Sandberg bluegrass, Wyoming big sagebrush
 Soughe: Wyoming big sagebrush, bluebunch wheatgrass
 Inclusion 1: Indian ricegrass, black sagebrush
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 3: Nevada bluegrass, basin wildrye

291--Gochea-Simon association***Composition*****Major Components**

Gochea loam, 2 to 8 percent slopes--55 percent
Simon silt loam, 4 to 15 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Aridic Duric Haploxerolls, fine-loamy, mixed, frigid very gravelly loam--5 percent
Inclusion 2: Aeris Fluvaquents, coarse-loamy, mixed (calcareous), mesic sandy loam--3 percent
Inclusion 3: Hunnton silt loam, 2 to 4 percent slopes--1 percent
Inclusion 4: Wieland silt loam, 2 to 4 percent slopes--1 percent

Map Unit Setting

Landscape position: Fan piedmonts

Gochea--Landform: Fan remnants; geomorphic position: summit; position on slope: lower

Simon--Landform: Fan remnants; geomorphic position: summit; position on slope: upper

Inclusion 1--Landform: Fan skirts; position on slope: lower

Inclusion 2--Landform: Inset fans

Inclusion 3--Landform: Fan remnants; position on slope: lower

Inclusion 4--Landform: Fan remnants; position on slope: lower

Major Component Description**Gochea Series**

Elevation: 5,600 to 6,200 feet

Precipitation: About 12 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 25 percent gravel

Surface layer texture: Loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Simon Series

Elevation: 5,600 to 6,200 feet

Precipitation: About 11 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 5 percent gravel

Surface layer texture: Silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Gochea: Sandberg bluegrass, Wyoming big sagebrush, bluebunch wheatgrass

Simon: Sandberg bluegrass, Wyoming big sagebrush, bluebunch wheatgrass

Inclusion 1: Thurber needlegrass, Wyoming big sagebrush, bluebunch wheatgrass

Inclusion 2: Sandberg bluegrass, basin big sagebrush

Inclusion 3: Sandberg bluegrass, Wyoming big sagebrush, cheatgrass

Inclusion 4: Sandberg bluegrass, Wyoming big sagebrush, cheatgrass

Ecological Site

Gochea: 025XY014NV

Simon: 025XY014NV

Inclusion 1: 025XY014NV

Inclusion 2: 025XY003NV

Inclusion 3: 025XY019NV

Inclusion 4: 025XY019NV

300--Ola, steep-Earcree-Ola association***Composition*****Major Components**

Ola gravelly coarse sandy loam, 15 to 50 percent slopes--40 percent

Earcree gravelly coarse sandy loam, 30 to 50 percent slopes--30 percent

Ola gravelly coarse sandy loam, 8 to 15 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Rock outcrop--8 percent

Inclusion 2: Welch silt loam, 0 to 2 percent slopes, frequently flooded--3 percent

Inclusion 3: Lithic Xeric Torriorthents, sandy-skeletal, mixed, frigid very gravelly loam--2 percent

Inclusion 4: Xica sandy loam, 4 to 15 percent slopes--2 percent

Map Unit Setting

Landscape position: Mountains

Ola--Landform: Mountains; geomorphic position: backslope; shape of slope: convex

Earcree--Landform: Mountains; geomorphic position:

backslope; shape of slope: concave; aspect: north

Ola--Landform: Mountains; geomorphic position: summit; position on slope: upper; shape of slope: convex

Inclusion 1--Landform: Mountains; geomorphic position: backslope

Inclusion 2--Landform: Drainageways

Inclusion 3--Landform: Mountains; geomorphic position: backslope

Inclusion 4--Landform: Mountains; geomorphic position: summit; position on slope: upper; shape of slope: convex

Major Component Description

Ola Series

Elevation: 6,000 to 8,500 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 5 percent cobbles; 20 percent gravel

Surface layer texture: Gravelly coarse sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from granitic rocks

Ear Cree Series

Elevation: 6,000 to 8,500 feet

Precipitation: About 16 inches

Air temperature: About 39 degrees

Frost-free season: About 70 days

Surface rock fragments: 5 percent cobbles; 20 percent gravel

Surface layer texture: Gravelly coarse sandy loam

Drainage class: Well drained

Dominant parent material: Colluvium derived from granitic rocks

Ola Series

Elevation: 6,000 to 8,500 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 5 percent cobbles; 20 percent gravel

Surface layer texture: Gravelly coarse sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from granitic rocks

Dominant Present Vegetation

Ola: Idaho fescue, bluebunch wheatgrass

Ear Cree: Idaho fescue, mountain big sagebrush, snowberry

Ola: Idaho fescue, bluebunch wheatgrass

Inclusion 1: None

Inclusion 2: Alpine timothy, sedge

Inclusion 3: Bluebunch wheatgrass, oceanspray

Inclusion 4: Idaho fescue, black sagebrush, low sagebrush

Ecological Site

Ola: 025XY012NV

Ear Cree: 025XY004NV

Ola: 025XY012NV

Inclusion 1: none

Inclusion 3--Landform: Mountains; geomorphic position: backslope

Major Component Description**Agort Series**

Elevation: 6,000 to 8,000 feet

Precipitation: About 14 inches

Air temperature: About 41 degrees

Frost-free season: About 85 days

Surface rock fragments: 5 percent cobbles; 35 percent gravel

Surface layer texture: Gravelly sandy loam

Drainage class: Somewhat excessively drained

Dominant parent material: Residuum and colluvium derived from granitic rocks

Xica Series

Elevation: 6,000 to 8,000 feet

Precipitation: About 18 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 10 percent gravel

Surface layer texture: Sandy loam

Drainage class: Well drained

Dominant parent material: Residuum derived from granitic rocks

Xica Series

Elevation: 6,000 to 8,000 feet

Precipitation: About 18 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 5 percent cobbles; 30 percent gravel

Surface layer texture: Gravelly loamy coarse sand

Drainage class: Well drained

Dominant parent material: Residuum derived from granitic rocks

Dominant Present Vegetation

Agort: Antelope bitterbrush, bluebunch wheatgrass

Xica: Idaho fescue, black sagebrush, low sagebrush

Xica: Thurber needlegrass, black sagebrush

Inclusion 1: Antelope bitterbrush, bluebunch wheatgrass, oceanspray

Inclusion 2: Antelope bitterbrush, bluebunch wheatgrass, oceanspray

Inclusion 3: None

Ecological Site

Inclusion 1--Landform: Fan remnants; geomorphic position: backslope; shape of slope: concave

Inclusion 2--Landform: Inset fans

Inclusion 3--Landform: Fan skirts

Major Component Description**Hussell Series**

Elevation: 5,300 to 6,500 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 2 percent gravel

Surface layer texture: Coarse sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from granitic rocks

Nevador Series

Elevation: 5,300 to 6,500 feet

Precipitation: About 9 inches

Air temperature: About 48 degrees

Frost-free season: About 115 days

Surface layer texture: Loamy fine sand

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Hussell: Indian ricegrass, Wyoming big sagebrush, needleandthread

Nevador: Sandberg bluegrass, Wyoming big

sagebrush, bluebunch wheatgrass
 Inclusion 1: Indian ricegrass, Thurber needlegrass, big sagebrush
 Inclusion 2: Indian ricegrass, Thurber needlegrass, Wyoming big sagebrush
 Inclusion 3: Basin wildrye, big sagebrush, black greasewood

Ecological Site

340--Xipe-Valmy-Ocala association

Composition

Major Components

Xipe silt loam, 0 to 2 percent slopes, frequently flooded--50 percent
 Valmy fine sandy loam, 2 to 8 percent slopes--20 percent
 Ocala silt loam, 0 to 2 percent slopes, rarely flooded--15 percent

Contrasting Inclusions

Inclusion 1: Xipe silt loam, 0 to 2 percent slopes, occasionally flooded--10 percent
 Inclusion 2: Xipe silt loam, drained, 0 to 2 percent slopes, rarely flooded--4 percent
 Inclusion 3: Ocala silt loam, strongly saline-alkali, 0 to 2 percent slopes, occasionally flooded--1 percent

Map Unit Setting

Landscape position: Intermontane basins
 Xipe--Landform: Flood plains
 Valmy--Landform: Stream terraces
 Ocala--Landform: Flood plains; shape of slope: concave
 Inclusion 1--Landform: Flood plains
 Inclusion 2--Landform: Flood plains
 Inclusion 3--Landform: Alluvial flats

Major Component Description

Xipe Series

Elevation: 5,000 to 5,500 feet
Precipitation: About 8 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from

mixed rocks, loess and volcanic ash

Valmy Series

Elevation: 5,000 to 5,500 feet
Precipitation: About 8 inches
Air temperature: About 50 degrees
Frost-free season: About 105 days
Surface rock fragments: 5 percent gravel
Surface layer texture: Fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Ocala Series

Elevation: 5,000 to 5,500 feet
Precipitation: About 7 inches
Air temperature: About 50 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Somewhat poorly drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Xipe: Nevada bluegrass, basin big sagebrush, basin wildrye, sedge
 Valmy: Basin big sagebrush, basin wildrye, black greasewood
 Ocala: Alkali sacaton, basin wildrye, black greasewood, inland saltgrass
 Inclusion 1: Basin big sagebrush, black greasewood, western wheatgrass
 Inclusion 2: Nevada bluegrass, basin big sagebrush, basin wildrye
 Inclusion 3: Basin wildrye, black greasewood

Ecological Site

Xipe: 025XY001NV

 Inclusion 4--Landform: Mountains; geomorphic position: backslope; aspect: south

Major Component Description**Rodie Series**

Elevation: 6,200 to 8,200 feet
Precipitation: About 13 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 5 percent cobbles; 55 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from pyroclastic and extrusive volcanic rocks

Shalclev Series

Elevation: 6,700 to 8,200 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 60 percent gravel
Surface layer texture: Extremely gravelly silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Pequop Series

Elevation: 6,200 to 8,200 feet
Precipitation: About 14 inches
Air temperature: About 43 degrees
Frost-free season: About 85 days
Surface rock fragments: 5 percent cobbles; 35 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Rodie: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Shalclev: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Pequop: Antelope bitterbrush, bluebunch wheatgrass

Inclusion 1: None
 Inclusion 2: Thurber needlegrass, black sagebrush,
 bluebunch wheatgrass
 Inclusion 3: Mountain brome, snowberry
 Inclusion 4: Antelope bitterbrush, bluebunch
 wheatgrass

Major Component Description

Rodie Series

Elevation: 6,500 to 7,800 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 5 percent cobbles; 55
 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from
 pyroclastic and extrusive volcanic rocks

Shalclev Series

Elevation: 6,500 to 7,800 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 60
 percent gravel
Surface layer texture: Extremely gravelly silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium
 derived from volcanic rocks

Agassiz Series

Elevation: 6,500 to 7,800 feet
Precipitation: About 16 inches
Air temperature: About 42 degrees
Frost-free season: About 65 days
Surface rock fragments: 10 percent cobbles; 55
 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum derived from
 limestone and dolomite

Dominant Present Vegetation

Rodie: Thurber needlegrass, black sagebrush,
 bluebunch wheatgrass
 Shalclev: Thurber needlegrass, black sagebrush,
 bluebunch wheatgrass
 Agassiz: Thurber needlegrass, bluebunch
 wheatgrass, curlleaf mountainmahogany
 Inclusion 1: Mountain brome, snowberry
 Inclusion 2: Idaho fescue, antelope bitterbrush,
 bluebunch wheatgrass
 Inclusion 3: Antelope bitterbrush, bluebunch
 wheatgrass

Inclusion 3--Landform: Hills; geomorphic position: backslope; shape of slope: convex; aspect: north

Major Component Description

Quopant Series

Elevation: 6,200 to 7,000 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 10 percent cobbles; 30 percent gravel

Surface layer texture: Very gravelly sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Coser Series

Elevation: 6,200 to 7,000 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 70 percent gravel

Surface layer texture: Gravelly clay loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Lerrow Series

Elevation: 6,200 to 7,000 feet

Precipitation: About 12 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 35 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dominant Present Vegetation

Quopant: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Coser: Idaho fescue, bluebunch wheatgrass, low sagebrush

Lerrow: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

430--Ocala-Kelk association

Composition

Major Components

Ocala silt loam, 0 to 2 percent slopes, occasionally flooded--50 percent

Kelk silt loam, 0 to 2 percent slopes, rarely flooded--40 percent

Contrasting Inclusions

Inclusion 1: Welch silt loam, 0 to 2 percent slopes, frequently flooded--5 percent

Inclusion 2: Sonoma silt loam, strongly saline-alkali, 0 to 2 percent slopes, rarely flooded--5 percent

Map Unit Setting

Landscape position: Fan piedmonts

Ocala--Landform: Inset fans

Kelk--Landform: Fan skirts

Inclusion 1--Landform: Drainageways

Inclusion 2--Landform: Inset fans

Major Component Description

Ocala Series

Elevation: 5,500 to 5,600 feet

Precipitation: About 7 inches
Air temperature: About 50 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Somewhat poorly drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Kelk Series

Elevation: 5,500 to 5,600 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Ocala: Basin wildrye, inland saltgrass, rubber rabbitbrush
 Kelk: Basin big sagebrush, inland saltgrass, rubber rabbitbrush
 Inclusion 1: Willow
 Inclusion 2: Basin wildrye, black greasewood, inland saltgrass

Ecological Site

431--Ocala-Batan-Devilsgait association

Composition

Major Components

Ocala silt loam, occasionally flooded, 0 to 2 percent slopes--40 percent
 Batan silt loam, 2 to 4 percent slopes--30 percent
 Devilsgait silt loam, drained, 0 to 2 percent slopes, occasionally flooded--15 percent

Contrasting Inclusions

Inclusion 1: Xerollic Haplargids, loamy-skeletal, mixed, mesic gravelly loam--6 percent
 Inclusion 2: Devilsgait silt loam, 0 to 2 percent slopes, frequently flooded--6 percent
 Inclusion 3: Ocala silt loam, strongly saline-alkali, 0 to 2 percent slopes, occasionally flooded--2 percent
 Inclusion 4: Xeric Torriorthents, fine-loamy, mixed (calcareous), mesic--1 percent

Map Unit Setting

Landscape position: Intermontane basins
 Ocala--Landform: Stream terraces
 Batan--Landform: Stream terraces
 Devilsgait--Landform: Flood plains
 Inclusion 1--Landform: Fan remnants
 Inclusion 2--Landform: Flood plains
 Inclusion 3--Landform: Flood plains; shape of slope: concave
 Inclusion 4--Landform: Stream terraces

Major Component Description

Ocala Series

Elevation: 5,400 to 6,000 feet
Precipitation: About 8 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Somewhat poorly drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Batan Series

Elevation: 5,400 to 6,000 feet
Precipitation: About 8 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Moderately well drained
Dominant parent material: Alluvium derived from volcanic rocks, loess and volcanic ash

Devilsgait Series

Elevation: 5,400 to 6,000 feet
Precipitation: About 8 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Ocala: Basin wildrye, black greasewood, inland saltgrass, rubber rabbitbrush
 Batan: Basin big sagebrush, basin wildrye, black greasewood, inland saltgrass
 Devilsgait: Basin big sagebrush, basin wildrye, rubber rabbitbrush

432--Ocala-Ixian association

Composition

Major Components

Ocala silty clay loam, 0 to 2 percent slopes, rarely flooded--70 percent
Ixian silty clay loam, 0 to 2 percent slopes, rarely flooded--20 percent

Contrasting Inclusions

Inclusion 1: Sonda silt loam, 0 to 2 percent slopes, rarely flooded--10 percent

Map Unit Setting

Landscape position: Bolsons

Ocala--Landform: Lake plains; shape of slope: concave

Ixian--Landform: Lake plains

Inclusion 1--Landform: Lake plains

Major Component Description

Ocala Series

Elevation: 4,700 to 5,000 feet

Precipitation: About 7 inches

Air temperature: About 48 degrees

Frost-free season: About 110 days

Surface layer texture: Silty clay loam

Drainage class: Somewhat poorly drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Ixian Series

Elevation: 4,700 to 5,000 feet

Precipitation: About 7 inches

Air temperature: About 47 degrees

Frost-free season: About 115 days

Surface layer texture: Silty clay loam

Drainage class: Somewhat poorly drained

Dominant parent material: Alluvium derived from

mixed rocks over lacustrine sediments

Dominant Present Vegetation

Ocala: Basin wildrye, black greasewood, inland saltgrass

Ixian: Alkali sacaton, black greasewood, inland saltgrass

Inclusion 1: Alkali sacaton, black greasewood

Major Component Description**Chen Series**

Elevation: 5,800 to 6,900 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days

Shalper Series

Elevation: 5,800 to 6,900 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Shalcleav Series

Elevation: 5,800 to 6,900 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 60 percent gravel
Surface layer texture: Extremely gravelly silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Chen: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Shalper: Wyoming big sagebrush, bluebunch wheatgrass
 Shalcleav: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Inclusion 1: Utah juniper, black sagebrush
 Inclusion 2: Idaho fescue, basin big sagebrush
 Inclusion 3: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 4: None

Ecological Site

Chen: 025XY017NV

480--Devilsgait-Kelk association**Composition****Major Components**

Devilsgait silt loam, drained, 0 to 2 percent slopes, rarely flooded--60 percent

Kelk silt loam, 2 to 4 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Fluvaquent Haplaquolls, fine-loamy, mixed, mesic gravelly silt loam, drained, 0 to 2 percent slopes--5 percent

Inclusion 2: Enko sandy loam, 2 to 4 percent slopes--8 percent

Inclusion 3: Aridic Duric Haploxerolls, coarse-loamy, mixed, mesic very gravelly loam--2 percent

Map Unit Setting

Landscape position: Intermontane basins

Devilsgait--Landform: Flood plains

Kelk--Landform: Stream terraces

Inclusion 1--Landform: Flood plains

Inclusion 2--Landform: Fan aprons

Inclusion 3--Landform: Fan skirts; position on slope: upper

Major Component Description

Devilsgait Series

Elevation: 5,700 to 5,800 feet

Precipitation: About 9 inches

Air temperature: About 46 degrees

Frost-free season: About 100 days

Surface layer texture: Silt loam

Drainage class: Very poorly drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Kelk Series

Elevation: 5,700 to 5,800 feet

Precipitation: About 9 inches

Air temperature: About 48 degrees

Frost-free season: About 110 days

Surface layer texture: Silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Devilsgait: Basin big sagebrush, basin wildrye

Kelk: Thurber needlegrass, Wyoming big sagebrush, bluebunch wheatgrass

Inclusion 1: Nevada bluegrass, basin wildrye

Inclusion 2: Thurber needlegrass, Wyoming big sagebrush

Inclusion 3: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Ecological Site

Devilsgait: 025XY003NV

Elevation: 6,800 to 8,600 feet

Precipitation: About 12 inches

Air temperature: About 42 degrees

Frost-free season: About 90 days

Surface rock fragments: 60 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Cleavage Series

Elevation: 6,800 to 8,600 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 65 percent gravel

Surface layer texture: Extremely gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Bullump Series

Elevation: 6,800 to 8,600 feet

Precipitation: About 15 inches

Air temperature: About 43 degrees

Frost-free season: About 80 days

Surface rock fragments: 5 percent cobbles; 20 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Colluvium derived from mixed rocks

Dominant Present Vegetation

Sumine: Antelope bitterbrush, bluebunch wheatgrass

Cleavage: Idaho fescue, Webber ricegrass, black sagebrush, low sagebrush

Bullump: California brome, Idaho fescue, mountain big sagebrush, snowberry

Inclusion 1: Bluebunch wheatgrass, mountain big sagebrush

Inclusion 2: Quaking aspen

Inclusion 3: Letterman needlegrass

Inclusion 4: Basin big sagebrush, basin wildrye

Ecological Site

Sumine: 025XY009NV

Cleavage: 025XY024NV

Bullump: 025XY016NV

580--Kelk-Sonoma association

Composition

Major Components

Kelk silt loam, 0 to 2 percent slopes--70 percent
 Sonoma silt loam, drained, 0 to 2 percent slopes,
 rarely flooded--20 percent

Contrasting Inclusions

Inclusion 1: Kelk silt loam, 0 to 2 percent slopes,
 rarely flooded--7 percent
 Inclusion 2: Enko very fine sandy loam, 0 to 2
 percent slopes--3 percent

Map Unit Setting

Landscape position: Intermontane basins
 Kelk--Landform: Fan skirts
 Sonoma--Landform: Flood plains
 Inclusion 1--Landform: Inset fans
 Inclusion 2--Landform: Fan skirts

Major Component Description

Kelk Series

Elevation: 5,700 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from
 mixed rocks, loess and volcanic ash

Sonoma Series

Elevation: 5,700 to 5,800 feet
Precipitation: About 8 inches
Air temperature: About 50 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Poorly drained
Dominant parent material: Alluvium derived from
 mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Kelk: Sandberg bluegrass, Wyoming big sagebrush,
 bottlebrush squirreltail
 Sonoma: Basin big sagebrush, basin wildrye
 Inclusion 1: Basin big sagebrush, greasewood
 Inclusion 2: Thurber needlegrass, Wyoming big
 sagebrush

Ecological Site

 upper

Major Component Description

Kelk Series

Elevation: 5,700 to 6,200 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from
 mixed rocks, loess and volcanic ash

Devilsgait Series

Elevation: 5,700 to 6,200 feet
Precipitation: About 10 inches
Air temperature: About 46 degrees
Frost-free season: About 100 days
Surface layer texture: Silt loam
Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from

mixed rocks, loess and volcanic ash

Welch Series

Elevation: 5,700 to 6,200 feet

Precipitation: About 9 inches

Air temperature: About 42 degrees

Frost-free season: About 90 days

Surface layer texture: Silty clay loam

Drainage class: Very poorly drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Kelk: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail

Devilsgait: Basin big sagebrush, basin wildrye

Welch: Nevada bluegrass, sedge, tufted hairgrass

Inclusion 1: Basin big sagebrush, basin wildrye

Inclusion 2: Thurber needlegrass, Wyoming big sagebrush

Inclusion 3: Thurber needlegrass, Wyoming big sagebrush

585--Valmy-Luap association

Composition

Major Components

Valmy loam, 2 to 4 percent slopes--55 percent

Luap very gravelly loam, slightly alkali, 2 to 4 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Loray gravelly loam, 2 to 4 percent slopes--5 percent

Inclusion 2: Gravier gravelly loam, 2 to 4 percent slopes--4 percent

Inclusion 3: Sondo silt loam, 4 to 15 percent slopes--1 percent

Map Unit Setting

Landscape position: Bolsons

Valmy--Landform: Fan skirts; position on slope: lower

Luap--Landform: Fan skirts; position on slope: upper

Inclusion 1--Landform: Fan skirts

Inclusion 2--Landform: Fan skirts; shape of slope: concave

Inclusion 3--Landform: Lake plains

Major Component Description

Valmy Series

Elevation: 4,800 to 4,950 feet

Precipitation: About 7 inches

Air temperature: About 49 degrees

Frost-free season: About 110 days

Surface rock fragments: 35 percent gravel

Surface layer texture: Loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Luap Series

Elevation: 4,800 to 4,950 feet

Precipitation: About 7 inches

Air temperature: About 47 degrees

Frost-free season: About 115 days

Surface rock fragments: 45 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Valmy: Bud sagebrush, shadscale

Luap: Bud sagebrush, shadscale

Inclusion 1: Indian ricegrass, bud sagebrush, shadscale

Inclusion 2: Indian ricegrass, bluegrass, winterfat

Inclusion 3: Sickie saltbush

Ecological Site

Valmy: 028BY074NV

590--Valmy-Enko association

Composition

Major Components

Valmy fine sandy loam, 0 to 2 percent slopes--55 percent

Enko fine sandy loam, 2 to 4 percent slopes--30 percent

Contrasting Inclusions

Inclusion 1: Oupico loam, 2 to 4 percent slopes--4

percent

Inclusion 2: Durorthidic Torriorthents, coarse-silty, mixed (calcareous), mesic sandy loam, 0 to 2 percent slopes--5 percent

Inclusion 3: Kelk silt loam, 0 to 2 percent slopes--2 percent

Inclusion 4: Durixerollic Camborthids, loamy-skeletal, mixed, mesic gravelly loam, 2 to 8 percent slopes--4 percent

Map Unit Setting

Landscape position: Fan piedmonts

Valmy--Landform: Fan skirts; position on slope: lower

Enko--Landform: Fan skirts; position on slope: upper

Inclusion 1--Landform: Fan remnants; geomorphic position: summit

Inclusion 2--Landform: Stream terraces

Inclusion 3--Landform: Inset fans

Inclusion 4--Landform: Fan remnants; geomorphic position: backslope

Major Component Description

Valmy Series

Elevation: 5,600 to 5,700 feet

Precipitation: About 9 inches

Air temperature: About 50 degrees

Frost-free season: About 105 days

Surface rock fragments: 5 percent gravel

Surface layer texture: Fine sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Enko Series

Elevation: 5,600 to 5,700 feet

Precipitation: About 9 inches

Air temperature: About 48 degrees

Frost-free season: About 110 days

Surface rock fragments: 2 percent gravel

Surface layer texture: Fine sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Valmy: Basin big sagebrush, basin wildrye, black greasewood

Enko: Wyoming big sagebrush

Inclusion 1: Thurber needlegrass, Wyoming big sagebrush

Inclusion 2: Black greasewood, inland saltgrass

Inclusion 3: Thurber needlegrass, Wyoming big sagebrush

Inclusion 4: Indian ricegrass, black sagebrush, bottlebrush squirreltail

Grina Series

Elevation: 6,000 to 7,100 feet

Precipitation: About 10 inches

Air temperature: About 48 degrees

Frost-free season: About 110 days

Surface rock fragments: 5 percent cobbles; 10 percent gravel

Surface layer texture: Silty clay loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Gochea Series*Elevation:* 6,000 to 7,100 feet*Precipitation:* About 12 inches*Air temperature:* About 44 degrees*Frost-free season:* About 90 days*Surface rock fragments:* 25 percent gravel*Surface layer texture:* Loam*Drainage class:* Well drained*Dominant parent material:* Alluvium derived from mixed rocks, loess and volcanic ash***Dominant Present Vegetation***

Grina: Utah juniper, Wyoming big sagebrush, bluebunch wheatgrass

Gochea: Thurber needlegrass, Wyoming big sagebrush, bluebunch wheatgrass

Inclusion 1: Idaho fescue, mountain big sagebrush

Inclusion 2: Bluebunch wheatgrass, mountain big sagebrush

Ecological Site

Grina: 025XY059NV

Gochea: 025XY014NV

Inclusion 1: 025XY012NV

Inclusion 2: 025XY009NV

620--Vadaho-Vadaho, strongly sloping association***Composition*****Major Components**

Vadaho silt loam, 2 to 8 percent slopes--55 percent

Vadaho silt loam, 8 to 15 percent slopes--30 percent

Contrasting Inclusions

Inclusion 1: Lithic Xerollic Haplargids, loamy, mixed, mesic very gravelly loam--10 percent

Inclusion 2: Welch loam, drained, 2 to 4 percent slopes--2 percent

Inclusion 3: Lithic Xeric Torriorthents, loamy, mixed (calcareous), mesic sandy loam--2 percent

Inclusion 4: Gochea silt loam, 8 to 15 percent slopes--1 percent

Map Unit Setting*Landscape position:* Fan piedmonts

Vadaho--Landform: Fan remnants; geomorphic position: summit

Vadaho--Landform: Fan remnants; geomorphic position: backslope

Inclusion 1--Landform: Pediments; geomorphic position: backslope; aspect: south

Inclusion 2--Landform: Inset fans

Inclusion 3--Landform: Pediments; geomorphic position: backslope

Inclusion 4--Landform: Fan remnants; geomorphic position: backslope; position on slope: lower

Major Component Description**Vadaho Series***Elevation:* 5,200 to 6,000 feet*Precipitation:* About 11 inches*Air temperature:* About 48 degrees*Frost-free season:* About 110 days*Surface rock fragments:* 5 percent gravel*Surface layer texture:* Silt loam*Drainage class:* Well drained*Dominant parent material:* Alluvium derived from mixed rocks, loess and volcanic ash**Vadaho Series***Elevation:* 5,200 to 6,000 feet*Precipitation:* About 11 inches*Air temperature:* About 48 degrees*Frost-free season:* About 110 days*Surface rock fragments:* 5 percent gravel*Surface layer texture:* Silt loam*Drainage class:* Well drained*Dominant parent material:* Alluvium derived from mixed rocks, loess and volcanic ash***Dominant Present Vegetation***

Vadaho: Wyoming big sagebrush, bluebunch wheatgrass, bottlebrush squirreltail

Vadaho: Wyoming big sagebrush, bluebunch wheatgrass, bottlebrush squirreltail

Inclusion 1: Wyoming big sagebrush, bluebunch wheatgrass

Inclusion 2: Basin big sagebrush, basin wildrye

Inclusion 3: Indian ricegrass, Wyoming big sagebrush, black sagebrush

Inclusion 4: Thurber needlegrass, Wyoming big sagebrush

621--Vadaho-Vadaho, moderately steep-Stampede association

Composition

Major Components

Vadaho silt loam, 4 to 15 percent slopes--55 percent
 Vadaho silt loam, 15 to 30 percent slopes--20 percent
 Stampede gravelly loam, 4 to 15 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Gochea silt loam, 2 to 8 percent slopes--5 percent
 Inclusion 2: Typic Durixerolls, fine-loamy, mixed, mesic loam--5 percent

Map Unit Setting

Landscape position: Hills and intermontane basins
 Vadaho--Landform: Fan remnants; geomorphic position: summit; position on slope: upper; shape of slope: convex
 Vadaho--Landform: Fan remnants; geomorphic position: backslope; shape of slope: convex; aspect: south
 Stampede--Landform: Fan remnants; geomorphic position: backslope; shape of slope: concave; aspect: north
 Inclusion 1--Landform: Inset fans
 Inclusion 2--Landform: Hills; geomorphic position: backslope

Major Component Description

Vadaho Series

Elevation: 5,700 to 6,100 feet
Precipitation: About 11 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 5 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Vadaho Series

Elevation: 5,700 to 6,100 feet
Precipitation: About 11 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 5 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Stampede Series

Elevation: 5,700 to 6,100 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Vadaho: Thurber needlegrass, Wyoming big sagebrush, bluebunch wheatgrass
 Vadaho: Thurber needlegrass, Wyoming big sagebrush, bluebunch wheatgrass
 Stampede: Thurber needlegrass, Wyoming big sagebrush, bluebunch wheatgrass
 Inclusion 1: Thurber needlegrass, big sagebrush
 Inclusion 2: Thurber needlegrass, big sagebrush

Ecological Site

 Vadaho: 025XY014NV
 Stampede: 025XY014NV
 Inclusion 1: 025XY014NV
 Inclusion 2: 025XY014NV

631--Pernty-Mclvey-Gollaher association

Composition

Major Components

Pernty very gravelly loam, 15 to 50 percent slopes--45 percent
 Mclvey gravelly loam, 15 to 50 percent slopes--30 percent
 Gollaher very gravelly loam, 15 to 50 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Sumine gravelly loam, 15 to 50 percent slopes--5 percent
 Inclusion 2: Hopeka gravelly loam, 15 to 50 percent slopes--5 percent

Map Unit Setting

Landscape position: Mountains
 Pernty--Landform: Mountains; geomorphic position: backslope; shape of slope: convex
 Mclvey--Landform: Mountains; geomorphic position: backslope; shape of slope: plane
 Gollaher--Landform: Mountains; geomorphic position: summit; position on slope: upper; shape of slope: convex

Inclusion 1--Landform: Mountains; geomorphic position: backslope; aspect: south
 Inclusion 2--Landform: Mountains; geomorphic position: summit

Major Component Description

Pernty Series

Elevation: 6,500 to 7,200 feet
Precipitation: About 12 inches
Air temperature: About 43 degrees
Frost-free season: About 90 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from mixed rocks

Mclvey Series

Elevation: 6,500 to 7,200 feet
Precipitation: About 14 inches
Air temperature: About 43 degrees
Frost-free season: About 90 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from mixed rocks

Gollaher Series

Elevation: 6,500 to 7,200 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 50 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Dominant Present Vegetation

Pernty: Sandberg bluegrass, antelope bitterbrush, bluebunch wheatgrass
 Mclvey: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass
 Gollaher: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Inclusion 1: Bluebunch wheatgrass, mountain big sagebrush
 Inclusion 2: Utah juniper, black sagebrush, singleleaf pinyon

Ecological Site

Pernty: 025XY012NV

Mclvey: 025XY012NV
 Gollaher: 025XY057NV
 Inclusion 1: 025XY009NV
 Inclusion 2: 028BY060NV

632--Pernty-Sumine-Shalclev association

Composition

Major Components

Pernty very gravelly loam, 15 to 50 percent slopes--50 percent
 Sumine very gravelly loam, 30 to 50 percent slopes--20 percent
 Shalclev extremely gravelly silt loam, 15 to 50 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Pachic Haploxerolls, loamy-skeletal, mixed, frigid gravelly silt loam--5 percent
 Inclusion 2: Hopeka gravelly loam, 15 to 50 percent slopes--5 percent
 Inclusion 3: Lithic Argixerolls, loamy-skeletal, mixed, frigid very gravelly loam--3 percent
 Inclusion 4: Pachic Cryoborolls, loamy-skeletal, mixed gravelly silt loam, 15 to 50 percent slopes--2 percent

Map Unit Setting

Landscape position: Mountains
 Pernty--Landform: Mountains; geomorphic position: backslope; position on slope: upper; shape of slope: convex
 Sumine--Landform: Mountains; geomorphic position: backslope; shape of slope: concave; aspect: south
 Shalclev--Landform: Mountains; geomorphic position: summit; position on slope: upper; shape of slope: convex
 Inclusion 1--Landform: Mountains; geomorphic position: backslope; position on slope: lower
 Inclusion 2--Landform: Mountains; geomorphic position: backslope; position on slope: upper
 Inclusion 3--Landform: Mountains; geomorphic position: summit
 Inclusion 4--Landform: Mountains; geomorphic position: backslope; shape of slope: concave; aspect: north

Major Component Description

Pernty Series

Elevation: 6,300 to 7,300 feet
Precipitation: About 12 inches

Air temperature: About 43 degrees
Frost-free season: About 90 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from mixed rocks

Sumine Series

Elevation: 6,300 to 7,300 feet
Precipitation: About 12 inches
Air temperature: About 42 degrees
Frost-free season: About 90 days
Surface rock fragments: 60 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from mixed rocks

Shalclev Series

Elevation: 6,300 to 7,300 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 60 percent gravel
Surface layer texture: Extremely gravelly silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Pernty: Idaho fescue, bluebunch wheatgrass
 Sumine: Antelope bitterbrush, bluebunch wheatgrass
 Shalclev: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Inclusion 1: Idaho fescue
 Inclusion 2: Black sagebrush, juniper, singleleaf pinyon
 Inclusion 3: Idaho fescue, serviceberry
 Inclusion 4: Mountain brome, slender wheatgrass

Ecological Site

Pernty: 025XY012NV
 Sumine: 025XY009NV
 Shalclev: 025XY057NV
 Inclusion 1: 025XY027NV
 Inclusion 2: 028BY060NV
 Inclusion 3: 025XY046NV
 Inclusion 4: 025XY004NV

633--Pernty-Tweener-Rock outcrop association

Composition

Major Components

Pernty very gravelly loam, 15 to 30 percent slopes--45 percent
 Tweener very gravelly loam, 15 to 50 percent slopes--20 percent
 Rock outcrop--20 percent

Contrasting Inclusions

Inclusion 1: Lithic Argixerolls, loamy-skeletal, mixed, frigid very gravelly loam--10 percent
 Inclusion 2: Typic Haploxerolls, loamy-skeletal, mixed, frigid very gravelly loam--2 percent
 Inclusion 3: Typic Haploxerolls, loamy-skeletal, mixed, frigid very gravelly loam--3 percent

Map Unit Setting

Landscape position: Hills
 Pernty--Landform: Hills; geomorphic position: backslope; position on slope: lower; shape of slope: convex
 Tweener--Landform: Hills; geomorphic position: backslope; position on slope: lower; shape of slope: convex; aspect: south
 Rock outcrop--Landform: Hills; geomorphic position: backslope
 Inclusion 1--Landform: Hills; geomorphic position: backslope; aspect: north
 Inclusion 2--Landform: Hills; geomorphic position: backslope; position on slope: lower
 Inclusion 3--Landform: Hills; geomorphic position: backslope; position on slope: lower; shape of slope: concave; aspect: south

Major Component Description

Pernty Series

Elevation: 6,700 to 6,900 feet
Precipitation: About 12 inches
Air temperature: About 43 degrees
Frost-free season: About 90 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from mixed rocks

Tweener Series

Elevation: 6,200 to 6,900 feet
Precipitation: About 12 inches

Air temperature: About 43 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 30 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Rock outcrop Miscellaneous Area

Elevation: 6,200 to 6,900 feet

Dominant Present Vegetation

Pernty: Antelope bitterbrush, bluebunch wheatgrass
 Tweener: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass
 Inclusion 1: Curleaf mountainmahogany
 Inclusion 2: Mountain big sagebrush
 Inclusion 3: Bluebunch wheatgrass, mountain big sagebrush

Ecological Site

Pernty: 025XY012NV
 Tweener: 025XY007NV
 Rock outcrop: None
 Inclusion 1: 028BY042NV
 Inclusion 2: 025XY076NV
 Inclusion 3: 025XY012NV

651--Scalfar-Cleavage-Hackwood association

Composition

Major Components

Scalfar very gravelly loam, 15 to 50 percent slopes--45 percent
 Cleavage extremely gravelly loam, 8 to 30 percent slopes--25 percent
 Hackwood gravelly loam, 15 to 30 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Hapgood gravelly loam, 15 to 30 percent slopes--5 percent
 Inclusion 2: Tweener gravelly loam, 15 to 30 percent slopes--5 percent
 Inclusion 3: Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid very gravelly loam, 15 to 50 percent slopes--3 percent
 Inclusion 4: Welch silt loam, 0 to 2 percent slopes, frequently flooded--2 percent

Map Unit Setting

Landscape position: Mountains
 Scalfar--Landform: Mountains; geomorphic position: backslope; position on slope: lower
 Cleavage--Landform: Mountains; geomorphic position: summit; position on slope: upper; shape of slope: convex
 Hackwood--Landform: Mountains; geomorphic position: backslope; shape of slope: concave; aspect: north
 Inclusion 1--Landform: Mountains; geomorphic position: backslope; position on slope: lower; shape of slope: concave; aspect: north
 Inclusion 2--Landform: Mountains; geomorphic position: summit; shape of slope: convex
 Inclusion 3--Landform: Mountains; geomorphic position: backslope; shape of slope: convex
 Inclusion 4--Landform: Drainageways

Major Component Description

Scalfar Series

Elevation: 6,800 to 8,000 feet
Precipitation: About 14 inches
Air temperature: About 41 degrees
Frost-free season: About 75 days
Surface rock fragments: 5 percent cobbles; 35 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from pyroclastic and extrusive volcanic rocks

Cleavage Series

Elevation: 6,800 to 8,000 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 65 percent gravel
Surface layer texture: Extremely gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Hackwood Series

Elevation: 6,800 to 8,000 feet
Precipitation: About 18 inches
Air temperature: About 41 degrees
Frost-free season: About 70 days
Surface rock fragments: 15 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained

Dominant parent material: Colluvium derived from pyroclastic and extrusive volcanic rocks

Dominant Present Vegetation

Scalfar: Idaho fescue, black sagebrush, bluebunch wheatgrass, low sagebrush

Cleavage: Idaho fescue, Webber ricegrass, black sagebrush, low sagebrush

Hackwood: California brome, quaking aspen, snowberry

Inclusion 1: Idaho fescue, mountain brome, snowberry

Inclusion 2: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass

Inclusion 3: Idaho fescue, bluebunch wheatgrass, serviceberry

Inclusion 4: Nevada bluegrass, willow

Ecological Site

Scalfar: 025XY024NV

Cleavage: 025XY024NV

Inclusion 3--Landform: Mountains; geomorphic position: backslope; position on slope: lower; shape of slope: concave

Inclusion 4--Landform: Mountains; geomorphic position: backslope; position on slope: lower; shape of slope: convex

Major Component Description

Scalfar Series

Elevation: 6,000 to 7,500 feet

Precipitation: About 14 inches

Air temperature: About 41 degrees

Frost-free season: About 75 days

Surface rock fragments: 5 percent cobbles; 35 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Colluvium derived from pyroclastic and extrusive volcanic rocks

Shalclev Series

Elevation: 6,000 to 7,500 feet

Precipitation: About 16 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 5 percent cobbles; 60 percent gravel

Surface layer texture: Extremely gravelly silt loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Quopant Series

Elevation: 6,000 to 7,500 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 10 percent cobbles; 30 percent gravel

Surface layer texture: Very gravelly sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dominant Present Vegetation

Scalfar: Idaho fescue, black sagebrush, bluebunch wheatgrass, low sagebrush
 Shalclev: Idaho fescue, black sagebrush, bluebunch wheatgrass
 Quopant: Indian ricegrass, black sagebrush, bluebunch wheatgrass
 Inclusion 1: Idaho fescue, mountain brome, snowberry
 Inclusion 2: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 3: Idaho fescue
 Inclusion 4: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Major Component Description

Hooplite Series

Elevation: 5,800 to 6,500 feet

Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface rock fragments: 70 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Hooplite Series

Elevation: 5,800 to 6,500 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface rock fragments: 70 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Ackett Series

Elevation: 5,800 to 6,500 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 5 percent cobbles; 60 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic rocks, loess and volcanic ash

Dominant Present Vegetation

Hooplite: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
Hooplite: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
Ackett: Indian ricegrass, Thurber needlegrass, black sagebrush
Inclusion 1: Indian ricegrass, black sagebrush, bottlebrush squirreltail
Inclusion 2: Thurber needlegrass, big sagebrush
Inclusion 3: Big sagebrush, black greasewood, inland saltgrass
Inclusion 4: None

679--Izar-Dewar-Izar, moderately steep association

Composition

Major Components

Izar very gravelly loam, 4 to 15 percent slopes--30 percent
 Dewar gravelly silt loam, 2 to 8 percent slopes--30 percent
 Izar very gravelly loam, 15 to 30 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Yuko very gravelly loam, 4 to 15 percent slopes--5 percent
 Inclusion 2: Wiffo very gravelly loam, 4 to 15 percent slopes--5 percent
 Inclusion 3: Pibler very gravelly loam, 2 to 8 percent slopes--3 percent
 Inclusion 4: Hundraw gravelly fine sandy loam, 4 to 15 percent slopes--2 percent

Map Unit Setting

Landscape position: Hills and intermontane basins
 Izar--Landform: Hills; geomorphic position: summit
 Dewar--Landform: Fan remnants; geomorphic position: summit; shape of slope: plane
 Izar--Landform: Hills; geomorphic position: backslope

Inclusion 1--Landform: Pediments; geomorphic position: backslope; position on slope: lower
 Inclusion 2--Landform: Inset fans
 Inclusion 3--Landform: Fan remnants; geomorphic position: summit; shape of slope: convex
 Inclusion 4--Landform: Hills; geomorphic position: backslope; shape of slope: convex

Major Component Description

Izar Series

Elevation: 5,000 to 5,700 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 60 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Somewhat excessively drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dewar Series

Elevation: 5,000 to 5,700 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Gravelly silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Izar Series

Elevation: 5,000 to 5,700 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 60 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Somewhat excessively drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dominant Present Vegetation

Izar: Indian ricegrass, Thurber needlegrass, black sagebrush
 Dewar: Wyoming big sagebrush, bluebunch wheatgrass
 Izar: Indian ricegrass, Thurber needlegrass, black sagebrush
 Inclusion 1: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush, basin wildrye

Major Component Description

Izar Series

Elevation: 5,600 to 6,500 feet

Precipitation: About 9 inches

Air temperature: About 46 degrees

Frost-free season: About 110 days

Surface rock fragments: 60 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Somewhat excessively drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Holborn Series

Elevation: 5,600 to 6,500 feet

Precipitation: About 10 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 25 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from mixed rocks

Kzin Series

Elevation: 5,600 to 6,500 feet

Precipitation: About 10 inches

Air temperature: About 47 degrees

Frost-free season: About 90 days

Surface rock fragments: 5 percent cobbles; 35 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Dominant Present Vegetation

Izar: Indian ricegrass, Thurber needlegrass, black sagebrush

Holborn: Indian ricegrass, black sagebrush

Kzin: Indian ricegrass, Utah juniper, black sagebrush, singleleaf pinyon

Inclusion 1: Sandberg bluegrass, Wyoming big sagebrush

Inclusion 2: Indian ricegrass, Wyoming big sagebrush, black sagebrush

Inclusion 3: Indian ricegrass, Thurber needlegrass, black greasewood

Inclusion 4: Thurber needlegrass, Wyoming big sagebrush, cheatgrass

Major Component Description

Izar Series

Elevation: 6,000 to 6,400 feet

Precipitation: About 9 inches

Air temperature: About 46 degrees

Frost-free season: About 110 days

Surface rock fragments: 60 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Somewhat excessively drained

Dominant parent material: Residium and colluvium derived from tuffaceous rocks

Zapa Series

Elevation: 6,000 to 6,400 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 55 percent gravel

Surface layer texture: Very gravelly silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Peeko Series

Elevation: 6,000 to 6,400 feet

Precipitation: About 9 inches

Air temperature: About 48 degrees

Frost-free season: About 110 days

Surface rock fragments: 25 percent gravel

Surface layer texture: Silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Izar: Indian ricegrass, Thurber needlegrass, black sagebrush

Zapa: Indian ricegrass, Thurber needlegrass, black sagebrush

Peeko: Indian ricegrass, Thurber needlegrass, black sagebrush

Elevation: 5,500 to 6,300 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 55 percent gravel
Surface layer texture: Very gravelly silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Puett Series

Elevation: 5,500 to 6,300 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 50 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from sandstone

Dominant Present Vegetation

Izar: Indian ricegrass, Thurber needlegrass, black sagebrush
 Zapa: Indian ricegrass, Thurber needlegrass, black sagebrush
 Puett: Indian ricegrass, Wyoming big sagebrush, black sagebrush
 Inclusion 1: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 2: Thurber needlegrass, big sagebrush
 Inclusion 3: Wyoming big sagebrush, basin wildrye,

bluebunch wheatgrass
Inclusion 4: Indian ricegrass, Wyoming big
sagebrush, needleandthread

Major Component Description

Oupico Series

Elevation: 5,600 to 6,000 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface layer texture: Sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from
mixed rocks

Oupico Series

Elevation: 5,600 to 6,000 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface layer texture: Sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from
mixed rocks

Peeko Series

Elevation: 5,600 to 6,000 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from
mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Oupico: Indian ricegrass, Wyoming big sagebrush,
needleandthread
Oupico: Indian ricegrass, Wyoming big sagebrush,
needleandthread
Peeko: Indian ricegrass, Thurber needlegrass, black
sagebrush
Inclusion 1: Indian ricegrass, black sagebrush
Inclusion 2: Big sagebrush, needleandthread
Inclusion 3: Wyoming big sagebrush, bluebunch
wheatgrass
Inclusion 4: Thurber needlegrass, black sagebrush

Major Component Description

Xica Series

Elevation: 6,200 to 7,300 feet

Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks, loess and volcanic ash

Shalclev Series

Elevation: 6,200 to 7,300 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 60 percent gravel
Surface layer texture: Extremely gravelly silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Hapgood Series

Elevation: 6,200 to 7,300 feet
Precipitation: About 16 inches
Air temperature: About 42 degrees
Frost-free season: About 70 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Xica: Idaho fescue, Thurber needlegrass, black sagebrush, low sagebrush
 Shalclev: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Hapgood: California brome, Idaho fescue, mountain big sagebrush, snowberry
 Inclusion 1: Bluebunch wheatgrass, snowberry
 Inclusion 2: Idaho fescue, low sagebrush
 Inclusion 3: Idaho fescue, antelope bitterbrush, mountain big sagebrush
 Inclusion 4: Sandberg bluegrass, black sagebrush, bottlebrush squirreltail

Ecological Site

Major Component Description

Xica Series

Elevation: 5,800 to 7,000 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Sandy loam
Drainage class: Well drained
Dominant parent material: Residuum derived from

granitic rocks

Xica Series

Elevation: 5,800 to 7,000 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Sandy loam
Drainage class: Well drained
Dominant parent material: Residuum derived from granitic rocks

Agort Series

Elevation: 5,800 to 7,000 feet
Precipitation: About 14 inches
Air temperature: About 41 degrees
Frost-free season: About 85 days
Surface rock fragments: 5 percent cobbles; 35 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Somewhat excessively drained
Dominant parent material: Residuum and colluvium derived from granitic rocks

Dominant Present Vegetation

Xica: Idaho fescue, black sagebrush, bluegrass, low sagebrush
 Xica: Idaho fescue, black sagebrush, low sagebrush
 Agort: Antelope bitterbrush, bluebunch wheatgrass
 Inclusion 1: Idaho fescue, antelope bitterbrush
 Inclusion 2: Bluebunch wheatgrass
 Inclusion 3: Mountain big sagebrush, mountain brome, snowberry
 Inclusion 4: Bluebunch wheatgrass, oceanspray

Ecological Site

730--Geysen-Welch-Batan association

Composition

Major Components

Geysen silt loam, 2 to 4 percent slopes--40 percent
 Welch silty clay loam, drained, 0 to 2 percent

slopes, rarely flooded--25 percent
 Batan silt loam, 2 to 4 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Xipe silt loam, 0 to 2 percent slopes, occasionally flooded--10 percent
 Inclusion 2: Cumulic Haploxerolls, loamy-skeletal, mixed, frigid silt loam--2 percent
 Inclusion 3: Xerollic Haplargids, loamy, mixed, mesic, shallow gravelly silt loam--2 percent
 Inclusion 4: Puett sandy loam, 4 to 15 percent slopes--1 percent

Map Unit Setting

Landscape position: Hills and intermontane basins
 Geysen--Landform: Fan remnants
 Welch--Landform: Flood plains
 Batan--Landform: Inset fans
 Inclusion 1--Landform: Flood plains
 Inclusion 2--Landform: Inset fans
 Inclusion 3--Landform: Hills; geomorphic position: summit
 Inclusion 4--Landform: Hills; geomorphic position: backslope

Major Component Description

Geysen Series

Elevation: 5,500 to 6,000 feet
Precipitation: About 8 inches
Air temperature: About 49 degrees
Frost-free season: About 105 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Welch Series

Elevation: 5,500 to 6,000 feet
Precipitation: About 9 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface layer texture: Silty clay loam
Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Batan Series

Elevation: 5,500 to 6,000 feet
Precipitation: About 8 inches
Air temperature: About 49 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam

Drainage class: Moderately well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Geysen: Big sagebrush, black greasewood, inland saltgrass
 Welch: Nevada bluegrass, basin big sagebrush, basin wildrye
 Batan: Sandberg bluegrass, big sagebrush, black greasewood
 Inclusion 1: Basin big sagebrush, basin wildrye, black greasewood
 Inclusion 2: Basin wildrye
 Inclusion 3: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 4: Indian ricegrass, black sagebrush

Ecological Site

 Inclusion 3: 025XY019NV
 Inclusion 4: 025XY025NV

731--Geysen-Crooked Creek-Batan association

Composition

Major Components

Geysen silt loam, 2 to 4 percent slopes--45 percent
 Crooked Creek silty clay loam, drained, 0 to 2 percent slopes, rarely flooded--25 percent
 Batan silt loam, 0 to 2 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Sonoma silt loam, drained, 0 to 2 percent slopes--7 percent
 Inclusion 2: Ocala silt loam, strongly saline-alkali, 0 to 2 percent slopes--2 percent
 Inclusion 3: Kelk silt loam, 0 to 2 percent slopes--1 percent

Map Unit Setting

Landscape position: Intermontane basins
 Geysen--Landform: Fan remnants
 Crooked Creek--Landform: Flood plains
 Batan--Landform: Fan skirts
 Inclusion 1--Landform: Flood plains

Inclusion 2--Landform: Inset fans
 Inclusion 3--Landform: Fan skirts

Major Component Description

Geysen Series

Elevation: 5,200 to 5,500 feet
Precipitation: About 8 inches
Air temperature: About 49 degrees
Frost-free season: About 105 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Crooked Creek Series

Elevation: 5,200 to 5,500 feet
Precipitation: About 8 inches
Air temperature: About 46 degrees
Frost-free season: About 90 days
Surface layer texture: Silty clay loam
Drainage class: Poorly drained
Dominant parent material: Alluvium derived from mixed rocks

Batan Series

Elevation: 5,200 to 5,500 feet
Precipitation: About 7 inches
Air temperature: About 49 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Moderately well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Geysen: Big sagebrush, black greasewood, bottlebrush squirreltail
 Crooked Creek: Basin big sagebrush, basin wildrye
 Batan: Big sagebrush, black greasewood
 Inclusion 1: Alkali sacaton, black greasewood, inland saltgrass
 Inclusion 2: Basin wildrye, black greasewood
 Inclusion 3: Thurber needlegrass, bluebunch wheatgrass

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Shalclev Series

Elevation: 6,000 to 7,000 feet

Precipitation: About 16 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 5 percent cobbles; 60 percent gravel

Surface layer texture: Extremely gravelly silt loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Cleavage: Idaho fescue, Sandberg bluegrass, low sagebrush

Graley: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Shalclev: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Inclusion 1: Basin big sagebrush, basin wildrye

Inclusion 2: Basin wildrye, bluebunch wheatgrass

Inclusion 3: Thurber needlegrass

Inclusion 4: None

Ecological Site

755--Cleavage-Sumine-Hapgood association

Composition

Major Components

Cleavage extremely gravelly loam, 15 to 30 percent slopes--35 percent
 Sumine very gravelly loam, 30 to 50 percent slopes--35 percent
 Hapgood very gravelly loam, 30 to 50 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Cleavage very gravelly loam, 15 to 30 percent slopes--6 percent
 Inclusion 2: Snotown very gravelly coarse sandy loam, 50 to 75 percent slopes--2 percent
 Inclusion 3: Pachic Haploxerolls, loamy-skeletal, mixed, frigid gravelly silt loam--2 percent

Map Unit Setting

Landscape position: Mountains
 Cleavage--Landform: Mountains; geomorphic position: summit; position on slope: upper; shape of slope: convex
 Sumine--Landform: Mountains; geomorphic position: backslope; aspect: south
 Hapgood--Landform: Mountains; geomorphic position: backslope; position on slope: upper; shape of slope: concave; aspect: north
 Inclusion 1--Landform: Mountains; geomorphic position: backslope; position on slope: lower; shape of slope: plane

Inclusion 2--Landform: Mountains; geomorphic position: summit; shape of slope: concave; aspect: north
 Inclusion 3--Landform: Mountains; geomorphic position: backslope; position on slope: lower; shape of slope: concave; aspect: north

Major Component Description

Cleavage Series

Elevation: 6,000 to 7,400 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 65 percent gravel
Surface layer texture: Extremely gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Sumine Series

Elevation: 6,000 to 7,400 feet
Precipitation: About 12 inches
Air temperature: About 42 degrees
Frost-free season: About 90 days
Surface rock fragments: 60 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Hapgood Series

Elevation: 6,000 to 7,400 feet
Precipitation: About 16 inches
Air temperature: About 42 degrees
Frost-free season: About 70 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Cleavage: Idaho fescue, black sagebrush, low sagebrush
 Sumine: Antelope bitterbrush, basin wildrye, bluebunch wheatgrass
 Hapgood: California brome, Idaho fescue, mountain big sagebrush, snowberry
 Inclusion 1: Idaho fescue, low sagebrush
 Inclusion 2: Letterman needlegrass, tailcup lupine
 Inclusion 3: Basin wildrye, big bluegrass

Ecological Site

Cleavage: 025XY024NV

Sumine: 025XY009NV
 Hapgood: 025XY004NV
 Inclusion 1: 025XY017NV
 Inclusion 2: 025XY028NV
 Inclusion 3: 025XY029NV

756--Cleavage-Sumine-Pernty association

Composition

Major Components

Cleavage extremely gravelly loam, 15 to 50 percent slopes--30 percent
 Sumine very gravelly loam, 15 to 50 percent slopes--30 percent
 Pernty very gravelly loam, 15 to 50 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Chayson loam, 4 to 15 percent slopes--10 percent
 Inclusion 2: Scalfar very gravelly loam, gravelly substratum, 4 to 15 percent slopes--3 percent
 Inclusion 3: Tweener very gravelly loam, 15 to 30 percent slopes--1 percent
 Inclusion 4: Welch silt loam, drained, 0 to 2 percent slopes, rarely flooded--1 percent

Map Unit Setting

Landscape position: Hills
 Cleavage--Landform: Hills; geomorphic position: summit; position on slope: upper; shape of slope: convex
 Sumine--Landform: Hills; geomorphic position: backslope; aspect: south
 Pernty--Landform: Hills; geomorphic position: backslope; shape of slope: concave; aspect: north
 Inclusion 1--Landform: Hills; geomorphic position: backslope; position on slope: lower
 Inclusion 2--Landform: Hills; geomorphic position: summit
 Inclusion 3--Landform: Hills; geomorphic position: backslope; shape of slope: convex
 Inclusion 4--Landform: Drainageways

Major Component Description

Cleavage Series

Elevation: 5,700 to 6,500 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 65 percent gravel
Surface layer texture: Extremely gravelly loam
Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Sumine Series

Elevation: 5,700 to 6,500 feet

Precipitation: About 12 inches

Air temperature: About 42 degrees

Frost-free season: About 90 days

Surface rock fragments: 60 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Pernty Series

Elevation: 5,700 to 6,500 feet

Precipitation: About 12 inches

Air temperature: About 43 degrees

Frost-free season: About 90 days

Surface rock fragments: 30 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from mixed rocks

Dominant Present Vegetation

Cleavage: Idaho fescue, Webber ricegrass, black sagebrush, low sagebrush

Sumine: Antelope bitterbrush, bluebunch wheatgrass

Pernty: Antelope bitterbrush, bluebunch wheatgrass

Inclusion 1: Idaho fescue

Inclusion 2: Thurber needlegrass, black sagebrush

Inclusion 3: Idaho fescue, antelope bitterbrush

Inclusion 4: Nevada bluegrass, basin wildrye

Ecological Site

Cleavage: 025XY024NV

Sumine: 025XY009NV

Pernty: 025XY012NV

Inclusion 1: 025XY027NV

Inclusion 2: 025XY057NV

Inclusion 3: 025XY007NV

Inclusion 4: 025XY003NV

757--Cleavage-Sumine-Snotown association

Composition

Major Components

Cleavage extremely gravelly loam, 15 to 50 percent slopes--50 percent

Sumine very gravelly loam, 15 to 50 percent slopes--25 percent

Snotown very gravelly coarse sandy loam, 15 to 50 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Cleavage very gravelly loam, 15 to 50 percent slopes--5 percent

Inclusion 2: Entic Cryumbrepts, loamy-skeletal, mixed very gravelly loam, 15 to 30 percent slopes--3 percent

Inclusion 3: Hapgood very gravelly loam, 15 to 50 percent slopes--2 percent

Map Unit Setting

Landscape position: Mountains

Cleavage--Landform: Mountains; geomorphic position: summit; shape of slope: convex

Sumine--Landform: Mountains; geomorphic position: backslope; aspect: south

Snotown--Landform: Mountains; position on slope: upper; shape of slope: concave; aspect: north

Inclusion 1--Landform: Mountains; geomorphic position: backslope; position on slope: lower; shape of slope: plane

Inclusion 2--Landform: Mountains; geomorphic position: backslope; position on slope: lower; shape of slope: concave; aspect: north

Inclusion 3--Landform: Mountains; geomorphic position: backslope; position on slope: lower; shape of slope: concave; aspect: north

Major Component Description

Cleavage Series

Elevation: 6,600 to 7,800 feet

Precipitation: About 12 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 65 percent gravel

Surface layer texture: Extremely gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Sumine Series

Elevation: 6,600 to 7,800 feet

Precipitation: About 12 inches

Air temperature: About 42 degrees

Frost-free season: About 90 days

Surface rock fragments: 60 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Snotown Series

Elevation: 6,600 to 7,800 feet

Precipitation: About 16 inches
Air temperature: About 41 degrees
Frost-free season: About 60 days
Surface rock fragments: 70 percent gravel
Surface layer texture: Very gravelly coarse sandy loam
Drainage class: Moderately well drained
Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Dominant Present Vegetation

Cleavage: Idaho fescue, Webber ricegrass, black sagebrush, low sagebrush
 Sumine: Antelope bitterbrush, bluebunch wheatgrass
 Snotown: Letterman needlegrass, tailcup lupine
 Inclusion 1: Idaho fescue, bluegrass, low sagebrush
 Inclusion 2: Mountain brome, quaking aspen
 Inclusion 3: Mountain brome, snowberry

Ecological Site

Cleavage: 025XY024NV
 Sumine: 025XY009NV
 Snotown: 025XY028NV
 Inclusion 1: 025XY017NV
 Inclusion 2: 025XY002NV
 Inclusion 3: 025XY004NV

758--Cleavage-Tweener-Graley association

Composition

Major Components

Cleavage extremely gravelly loam, 4 to 15 percent slopes--40 percent
 Tweener very gravelly loam, 15 to 50 percent slopes--25 percent
 Graley very gravelly loam, 15 to 50 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Sumine very gravelly loam, 15 to 50 percent slopes--4 percent
 Inclusion 2: Bullump gravelly loam, 15 to 50 percent slopes--4 percent
 Inclusion 3: Hapgood very gravelly loam, 15 to 50 percent slopes--4 percent
 Inclusion 4: Chen very gravelly loam, 15 to 30 percent slopes--3 percent

Map Unit Setting

Landscape position: Hills
 Cleavage--Landform: Hills; geomorphic position: summit; position on slope: upper; shape of slope: convex

Tweener--Landform: Hills; geomorphic position: backslope; shape of slope: convex
 Graley--Landform: Hills; geomorphic position: backslope; shape of slope: plane
 Inclusion 1--Landform: Hills; geomorphic position: backslope; shape of slope: convex; aspect: south
 Inclusion 2--Landform: Hills; geomorphic position: backslope; shape of slope: concave; aspect: south
 Inclusion 3--Landform: Hills; geomorphic position: backslope; shape of slope: concave; aspect: north
 Inclusion 4--Landform: Hills; geomorphic position: backslope; position on slope: lower; shape of slope: plane; aspect: north

Major Component Description

Cleavage Series

Elevation: 6,500 to 7,400 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 65 percent gravel
Surface layer texture: Extremely gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Tweener Series

Elevation: 6,500 to 7,400 feet
Precipitation: About 12 inches
Air temperature: About 43 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 30 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Graley Series

Elevation: 6,500 to 7,400 feet
Precipitation: About 11 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 55 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Cleavage: Idaho fescue, Webber ricegrass, black sagebrush, low sagebrush

Tweener: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass
 Graley: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 1: Basin wildrye, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 2: Basin wildrye, mountain big sagebrush, mountain brome
 Inclusion 3: Mountain brome, snowberry
 Inclusion 4: Idaho fescue, low sagebrush

Inclusion 4--Landform: Drainageways

Major Component Description

Cleavage Series

Elevation: 6,800 to 7,600 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 65 percent gravel

Surface layer texture: Extremely gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Tweener Series

Elevation: 6,800 to 7,600 feet

Precipitation: About 14 inches

Air temperature: About 43 degrees

Frost-free season: About 90 days

Surface rock fragments: 5 percent cobbles; 30 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Scalfar Series

Elevation: 6,800 to 7,600 feet

Precipitation: About 14 inches

Air temperature: About 41 degrees

Frost-free season: About 75 days

Surface rock fragments: 5 percent cobbles; 35 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Colluvium derived from volcanic rocks

Dominant Present Vegetation

Cleavage: Idaho fescue, Webber ricegrass, black sagebrush, low sagebrush

Tweener: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass

Scalfar: Idaho fescue, black sagebrush, low sagebrush

Inclusion 1: Idaho fescue, mountain big sagebrush, serviceberry

Inclusion 2: None

Inclusion 3: Idaho fescue, snowberry

Inclusion 4: Nevada bluegrass, alpine timothy

Ecological Site

Cleavage: 025XY024NV

Tweener: 025XY007NV

Scalfar: 025XY024NV

Inclusion 1: 025XY046NV

Inclusion 2: 025XY012NV

Inclusion 3: 025XY012NV

Inclusion 4: 025XY005NV

760--Jericho-Peeko-Izar association

Composition

Major Components

Jericho gravelly sandy loam, 2 to 8 percent slopes--40 percent

Peeko silt loam, 2 to 8 percent slopes--25 percent

Izar very gravelly loam, 15 to 50 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Kelk silt loam, 2 to 8 percent slopes--4 percent

Inclusion 2: Gravier gravelly loam, 2 to 8 percent slopes--4 percent

Inclusion 3: Oupico gravelly silt loam, 2 to 8 percent slopes--4 percent

Inclusion 4: Yuko gravelly sandy loam, 15 to 30 percent slopes--3 percent

Map Unit Setting

Landscape position: Fan piedmonts

Jericho--Landform: Fan remnants; geomorphic position: summit

Peeko--Landform: Fan remnants; geomorphic position: summit

Izar--Landform: Pediments; geomorphic position: backslope

Inclusion 1--Landform: Inset fans

Inclusion 2--Landform: Fan remnants; geomorphic position: summit; shape of slope: concave

Inclusion 3--Landform: Fan remnants; geomorphic position: summit; position on slope: lower

Inclusion 4--Landform: Pediments; geomorphic position: backslope; aspect: south

Major Component Description

Jericho Series

Elevation: 5,300 to 5,700 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 15 percent gravel

Surface layer texture: Gravelly sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks

Peeko Series

Elevation: 5,300 to 5,700 feet

Precipitation: About 9 inches

Air temperature: About 48 degrees

Frost-free season: About 110 days

Surface rock fragments: 25 percent gravel

Surface layer texture: Silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Izar Series

Elevation: 5,300 to 5,700 feet

Precipitation: About 9 inches

Air temperature: About 46 degrees

Frost-free season: About 110 days

Surface rock fragments: 60 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Somewhat excessively drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dominant Present Vegetation

Jericho: Thurber needlegrass, Wyoming big sagebrush, bluebunch wheatgrass

Peeko: Indian ricegrass, Thurber needlegrass, black sagebrush

Izar: Indian ricegrass, Thurber needlegrass, black sagebrush

Inclusion 1: Thurber needlegrass, Wyoming big sagebrush, bottlebrush squirreltail

Inclusion 2: Indian ricegrass, bud sagebrush, winterfat

Inclusion 3: Wyoming big sagebrush, cheatgrass, needleandthread

Inclusion 4: Wyoming big sagebrush, basin wildrye, bluebunch wheatgrass

Ecological Site

Jericho: 025XY019NV

Major Component Description

Jericho Series

Elevation: 6,400 to 6,900 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 15 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from
 mixed rocks

Pequop Series

Elevation: 6,400 to 6,900 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 100 days
Surface rock fragments: 5 percent cobbles; 35
 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium
 derived from tuffaceous rocks

Yuko Series

Elevation: 6,400 to 6,900 feet
Precipitation: About 10 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 5 percent cobbles; 25
 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium
 derived from tuffaceous rocks

Dominant Present Vegetation

Jericho: Sandberg bluegrass, Wyoming big
 sagebrush, bottlebrush squirreltail, cheatgrass
 Pequop: Idaho fescue, bluebunch wheatgrass
 Yuko: Wyoming big sagebrush, basin wildrye,
 bluebunch wheatgrass
 Inclusion 1: Indian ricegrass, Wyoming big
 sagebrush, black sagebrush
 Inclusion 2: Bluebunch wheatgrass
 Inclusion 3: Indian ricegrass, black sagebrush
 Inclusion 4: Idaho fescue, serviceberry, snowberry

Ecological Site

Jericho: 025XY019NV
 Pequop: 025XY012NV
 Yuko: 025XY015NV

 Inclusion 2--Landform: Inset fans
 Inclusion 3--Landform: Hills; geomorphic position: summit

Major Component Description

Puett Series

Elevation: 5,800 to 6,300 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 50 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Peeko Series

Elevation: 5,800 to 6,300 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface rock fragments: 25 percent gravel

Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Yuko Series

Elevation: 5,800 to 6,300 feet
Precipitation: About 10 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 5 percent cobbles; 25 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dominant Present Vegetation

Puett: Indian ricegrass, Wyoming big sagebrush, black sagebrush
 Peeko: Indian ricegrass, Thurber needlegrass, black sagebrush
 Yuko: Wyoming big sagebrush, basin wildrye, bluebunch wheatgrass
 Inclusion 1: Indian ricegrass, black sagebrush
 Inclusion 2: Thurber needlegrass, big sagebrush
 Inclusion 3: Thurber needlegrass, black sagebrush

Ecological Site

Major Component Description

Puett Series

Elevation: 6,300 to 6,700 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 50 percent gravel

Surface layer texture: Gravelly sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Izar Series

Elevation: 6,300 to 6,700 feet

Precipitation: About 9 inches

Air temperature: About 46 degrees

Frost-free season: About 110 days

Surface rock fragments: 60 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Somewhat excessively drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Shalper Series

Elevation: 6,300 to 6,700 feet

Precipitation: About 10 inches

Air temperature: About 44 degrees

Frost-free season: About 100 days

Surface rock fragments: 40 percent gravel

Surface layer texture: Very gravelly sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dominant Present Vegetation

Puett: Indian ricegrass, Wyoming big sagebrush, black sagebrush

Izar: Indian ricegrass, Thurber needlegrass, black sagebrush

Shalper: Wyoming big sagebrush, bluebunch wheatgrass

Inclusion 1: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Inclusion 2: Indian ricegrass, black sagebrush

Inclusion 3: Indian ricegrass, black sagebrush

Inclusion 4: None

Affey--Landform: Fan remnants; geomorphic position: summit; shape of slope: plane

Pamison--Landform: Fan remnants; geomorphic position: backslope; shape of slope: plane

Inclusion 1--Landform: Pediments; geomorphic position: backslope; aspect: south

Inclusion 2--Landform: Fan remnants; geomorphic position: backslope; aspect: north

Inclusion 3--Landform: Fan remnants; geomorphic position: summit

Major Component Description

Pamison Series

Elevation: 5,600 to 7,600 feet

Precipitation: About 12 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 60 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Moderately well drained

Dominant parent material: Alluvium derived from mixed rocks

Affey Series

Elevation: 5,600 to 7,600 feet

Precipitation: About 11 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 35 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Moderately well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Pamison Series

Elevation: 5,600 to 7,600 feet

Precipitation: About 12 inches

Air temperature: About 44 degrees

Frost-free season: About 85 days

Surface rock fragments: 60 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Moderately well drained

Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Pamison: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Affey: Thurber needlegrass, basin big sagebrush, bluebunch wheatgrass

Pamison: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Inclusion 1: Indian ricegrass, black sagebrush

Inclusion 2: Antelope bitterbrush

Inclusion 3: Indian ricegrass, Thurber needlegrass, black sagebrush

Ecological Site

Pamison: 024XY031NV

Affey: 025XY014NV

Pamison: 024XY031NV

Inclusion 1: 024XY030NV

Inclusion 2: 025XY012NV

Inclusion 3: 024XY031NV

851--Pamison-Amtoft-Coser association

Composition

Major Components

Pamison gravelly loam, 8 to 30 percent slopes--35 percent

Amtoft extremely gravelly loam, 15 to 50 percent slopes--25 percent

Coser gravelly clay loam, 15 to 50 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Arcia silt loam, 8 to 30 percent slopes--8 percent

Inclusion 2: Arva loam, 4 to 15 percent slopes--5 percent

Inclusion 3: Ekim very gravelly loam, 15 to 50 percent slopes--2 percent

Map Unit Setting

Landscape position: Hills and intermontane basins

Pamison--Landform: Fan remnants

Amtoft--Landform: Hills; geomorphic position: summit; position on slope: upper; shape of slope: convex

Coser--Landform: Hills; geomorphic position: backslope; position on slope: upper; shape of slope: concave
 Inclusion 1--Landform: Hills; geomorphic position: backslope; shape of slope: concave; aspect: north
 Inclusion 2--Landform: Hills; geomorphic position: backslope; position on slope: lower; shape of slope: concave
 Inclusion 3--Landform: Hills; geomorphic position: backslope; shape of slope: concave; aspect: south

Major Component Description

Pamison Series

Elevation: 6,000 to 7,000 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 60 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Moderately well drained
Dominant parent material: Alluvium derived from mixed rocks

Amtoft Series

Elevation: 6,000 to 7,000 feet
Precipitation: About 12 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface rock fragments: 15 percent cobbles; 70 percent gravel
Surface layer texture: Extremely gravelly loam
Drainage class: Somewhat excessively drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Coser Series

Elevation: 6,000 to 7,000 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 70 percent gravel
Surface layer texture: Gravelly clay loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Dominant Present Vegetation

Pamison: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Amtoft: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Coser: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Inclusion 1: Idaho fescue, antelope bitterbrush
 Inclusion 2: Idaho fescue
 Inclusion 3: Antelope bitterbrush, mountain big sagebrush

Ecological Site

Pamison: 024XY031NV
 Amtoft: 025XY057NV
 Coser: 025XY017NV
 Inclusion 1: 025XY012NV
 Inclusion 2: 025XY027NV
 Inclusion 3: 025XY009NV

880--Heckison-Xerxes-Shalper association

Composition

Major Components

Heckison silt loam, 2 to 8 percent slopes--35 percent
 Xerxes extremely cobbly loamy sand, 15 to 50 percent slopes--25 percent
 Shalper very gravelly loam, 4 to 15 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Aridic Argixerolls, fine-loamy, mixed, frigid very gravelly loam--5 percent
 Inclusion 2: Pachic Argixerolls, fine-loamy, mixed, frigid gravelly silt loam--5 percent
 Inclusion 3: Hundraw gravelly fine sandy loam, 15 to 50 percent slopes--5 percent

Map Unit Setting

Landscape position: Hills
 Heckison--Landform: Hills; geomorphic position: summit
 Xerxes--Landform: Hills; geomorphic position: backslope
 Shalper--Landform: Hills; geomorphic position: summit
 Inclusion 1--Landform: Hills; geomorphic position: backslope; aspect: north
 Inclusion 2--Landform: Hills; geomorphic position: summit; position on slope: lower
 Inclusion 3--Landform: Hills; geomorphic position: backslope; aspect: south

Major Component Description

Heckison Series

Elevation: 6,200 to 6,700 feet

Precipitation: About 12 inches
Air temperature: About 46 degrees
Frost-free season: About 85 days
Surface rock fragments: 5 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from volcanic rocks, loess and volcanic ash

Xerxes Series

Elevation: 6,200 to 6,700 feet
Precipitation: About 12 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface rock fragments: 20 percent cobbles; 45 percent gravel
Surface layer texture: Extremely cobbly loamy sand
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks, loess and volcanic ash

Shalper Series

Elevation: 6,200 to 6,700 feet
Precipitation: About 10 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Heckison: Big sagebrush, bluebunch wheatgrass
 Xerxes: Wyoming big sagebrush
 Shalper: Wyoming big sagebrush, bluebunch wheatgrass
 Inclusion 1: Idaho fescue, antelope bitterbrush, mountain big sagebrush
 Inclusion 2: Idaho fescue
 Inclusion 3: Indian ricegrass, Utah juniper, black sagebrush

Ecological Site

Heckison: 025XY014NV
 Xerxes: 025XY021NV
 Shalper: 025XY021NV
 Inclusion 1: 025XY012NV
 Inclusion 2: 025XY027NV
 Inclusion 3: 025XY060NV

881--Gochea-Chayson-Pamison association***Composition*****Major Components**

Gochea loam, 2 to 8 percent slopes--40 percent
 Chayson loam, 2 to 8 percent slopes--25 percent
 Pamison gravelly loam, 4 to 8 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Pachic Argixerolls, fine-loamy, mixed, frigid gravelly silt loam--8 percent
 Inclusion 2: Donna gravelly loam, 2 to 8 percent slopes--7 percent

Map Unit Setting

Landscape position: Fan piedmonts
 Gochea--Landform: Fan remnants; geomorphic position: summit
 Chayson--Landform: Fan remnants; geomorphic position: backslope; shape of slope: concave
 Pamison--Landform: Fan remnants; geomorphic position: summit; shape of slope: convex
 Inclusion 1--Landform: Fan remnants; geomorphic position: backslope; shape of slope: concave; aspect: north
 Inclusion 2--Landform: Fan remnants; geomorphic position: summit

Major Component Description**Gochea Series**

Elevation: 6,100 to 6,700 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Chayson Series

Elevation: 6,100 to 6,700 feet
Precipitation: About 14 inches
Air temperature: About 43 degrees
Frost-free season: About 100 days
Surface layer texture: Loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from volcanic rocks, loess and volcanic ash

Pamison Series

Elevation: 6,100 to 6,700 feet

Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 60 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Moderately well drained
Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Gochea: Thurber needlegrass, basin big sagebrush, bluebunch wheatgrass, cheatgrass
 Chayson: Basin big sagebrush, bluebunch wheatgrass
 Pamison: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Inclusion 1: Idaho fescue, antelope bitterbrush
 Inclusion 2: Alkali sagebrush, bottlebrush squirreltail, low sagebrush

Ecological Site

Gochea: 025XY014NV
 Chayson: 025XY027NV
 Pamison: 024XY031NV
 Inclusion 1: 025XY012NV
 Inclusion 2: 025XY018NV

930--Orovada, nearly level-Kelk-Orovada association

Composition

Major Components

Orovada loam, 0 to 2 percent slopes--35 percent
 Kelk silt loam, 0 to 2 percent slopes--35 percent
 Orovada very fine sandy loam, 2 to 8 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Xerollic Camborthids, coarse-loamy, mixed, mesic silt loam--5 percent
 Inclusion 2: Dewar gravelly silt loam, 2 to 8 percent slopes--5 percent

Map Unit Setting

Landscape position: Intermontane basins
 Orovada--Landform: Inset fans
 Kelk--Landform: Inset fans
 Orovada--Landform: Fan skirts
 Inclusion 1--Landform: Flood plains
 Inclusion 2--Landform: Fan skirts

Major Component Description

Orovada Series

Elevation: 5,400 to 5,800 feet

Precipitation: About 8 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface layer texture: Loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Kelk Series

Elevation: 5,400 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Orovada Series

Elevation: 5,400 to 5,800 feet
Precipitation: About 8 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface layer texture: Very fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Orovada: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail
 Kelk: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail
 Orovada: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail
 Inclusion 1: Basin big sagebrush, black greasewood
 Inclusion 2: Sandberg bluegrass, Thurber needlegrass, Wyoming big sagebrush

Ecological Site

Orovada: 025XY019NV
 Kelk: 025XY019NV
 Orovada: 025XY019NV
 Inclusion 1: 024XY006NV
 Inclusion 2: 025XY019NV

931--Orovada-Oupico-Izar association

Composition

Major Components

Orovada loam, 2 to 8 percent slopes--35 percent
 Oupico sandy loam, 4 to 15 percent slopes--30 percent

Izar very gravelly loam, 15 to 50 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Bilbo very gravelly loam, 4 to 15 percent slopes--5 percent

Inclusion 2: Yuko gravelly sandy loam, 15 to 50 percent slopes--4 percent

Inclusion 3: Puett sandy loam, 15 to 50 percent slopes--1 percent

Map Unit Setting

Landscape position: Hills and intermontane basins

Orovada--Landform: Inset fans

Oupico--Landform: Fan remnants; geomorphic position: summit; position on slope: upper

Izar--Landform: Hills; geomorphic position: backslope

Inclusion 1--Landform: Hills; geomorphic position: backslope

Inclusion 2--Landform: Hills; geomorphic position: backslope; aspect: south

Inclusion 3--Landform: Hills; geomorphic position: backslope; shape of slope: convex

Major Component Description

Orovada Series

Elevation: 5,500 to 5,700 feet

Precipitation: About 8 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface layer texture: Loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Oupico Series

Elevation: 5,500 to 6,000 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface layer texture: Sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks

Izar Series

Elevation: 5,500 to 6,000 feet

Precipitation: About 9 inches

Air temperature: About 46 degrees

Frost-free season: About 110 days

Surface rock fragments: 60 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Somewhat excessively drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dominant Present Vegetation

Orovada: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail

Oupico: Indian ricegrass, basin big sagebrush, needleandthread

Izar: Indian ricegrass, Thurber needlegrass, black sagebrush

Inclusion 1: Thurber needlegrass, Wyoming big sagebrush, cheatgrass

Inclusion 2: Wyoming big sagebrush, basin wildrye, bluebunch wheatgrass

Inclusion 3: Indian ricegrass, Wyoming big sagebrush, black sagebrush

Ecological Site

Orovada: 025XY019NV

Oupico: 024XY017NV

Izar: 024XY030NV

Inclusion 1: 025XY019NV

Inclusion 2: 025XY015NV

Inclusion 3: 025XY025NV

932--Orovada-Xipe-Ocala association

Composition

Major Components

Orovada loam, 2 to 4 percent slopes--40 percent

Xipe silt loam, 0 to 2 percent slopes, frequently flooded--30 percent

Ocala silt loam, 0 to 2 percent slopes, occasionally flooded--15 percent

Contrasting Inclusions

Inclusion 1: Xipe silt loam, 0 to 2 percent slopes, occasionally flooded--7 percent

Inclusion 2: Welch silt loam, drained, 0 to 2 percent slopes, occasionally flooded--7 percent

Inclusion 3: Welch silt loam, 0 to 2 percent slopes, frequently flooded--1 percent

Map Unit Setting

Landscape position: Intermontane basins

Orovada--Landform: Stream terraces; position on slope: upper

Xipe--Landform: Flood plains

Ocala--Landform: Drainageways; position on slope: lower

Inclusion 1--Landform: Flood plains

Inclusion 2--Landform: Flood plains

Inclusion 3--Landform: Drainageways

Major Component Description

Orovada Series

Elevation: 4,800 to 5,500 feet

Precipitation: About 8 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface layer texture: Loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Xipe Series

Elevation: 4,800 to 5,500 feet

Precipitation: About 8 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface layer texture: Silt loam

Drainage class: Very poorly drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Ocala Series

Elevation: 4,800 to 5,500 feet

Precipitation: About 8 inches

Air temperature: About 48 degrees

Frost-free season: About 110 days

Surface layer texture: Silt loam

Drainage class: Somewhat poorly drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Orovada: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail

Xipe: Nevada bluegrass, basin wildrye, creeping wildrye, sedge

Ocala: Basin wildrye, black greasewood, inland saltgrass

Inclusion 1: Basin big sagebrush, basin wildrye, black greasewood

Inclusion 2: Basin big sagebrush, basin wildrye

Inclusion 3: Nevada bluegrass

Ecological Site

Inclusion 2--Landform: Fan remnants; geomorphic position: summit; shape of slope: concave

Inclusion 3--Landform: Pediments; geomorphic position: backslope; aspect: south

Inclusion 4--Landform: Inset fans

Major Component Description

Hundraw Series

Elevation: 5,800 to 6,300 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 30 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from sedimentary rocks, loess and volcanic ash

Anowell Series

Elevation: 5,800 to 6,300 feet

Precipitation: About 10 inches

Air temperature: About 46 degrees

Frost-free season: About 110 days
Surface rock fragments: 50 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Peeko Series

Elevation: 5,800 to 6,300 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Hundraw: Indian ricegrass, black sagebrush
 Anowell: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Peeko: Indian ricegrass, Thurber needlegrass, black sagebrush
 Inclusion 1: Indian ricegrass, black sagebrush
 Inclusion 2: Indian ricegrass, black sagebrush

944--Hundraw, eroded-Peeko-Hundraw association

Composition

Major Components

Hundraw gravelly fine sandy loam, 15 to 50 percent slopes, eroded--35 percent

Peeko silt loam, 4 to 15 percent slopes--30 percent

Hundraw gravelly loam, 15 to 50 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Puett gravelly fine sandy loam, 15 to 50 percent slopes--5 percent

Inclusion 2: Aridic Haploxerolls, loamy, mixed, frigid, shallow very gravelly loam--5 percent

Inclusion 3: Xerollic Camborthids, loamy, mixed, mesic, shallow gravelly loam--5 percent

Map Unit Setting

Landscape position: Fan piedmonts

Hundraw--Landform: Pediments; geomorphic position: backslope; shape of slope: concave

Peeko--Landform: Fan remnants; geomorphic position: summit

Hundraw--Landform: Pediments; geomorphic position: backslope; shape of slope: convex

Inclusion 1--Landform: Pediments; geomorphic position: backslope; position on slope: upper; aspect: north

Inclusion 2--Landform: Pediments; geomorphic position: backslope; position on slope: lower; aspect: north

Inclusion 3--Landform: Pediments; geomorphic position: summit; shape of slope: concave

Major Component Description

Hundraw Series

Elevation: 5,400 to 6,400 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 30 percent gravel

Surface layer texture: Gravelly fine sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from sedimentary rocks, loess and volcanic ash

Peeko Series

Elevation: 5,400 to 6,400 feet

Precipitation: About 9 inches

Air temperature: About 48 degrees

Frost-free season: About 110 days

Surface rock fragments: 25 percent gravel

Surface layer texture: Silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Hundraw Series

Elevation: 5,400 to 6,400 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 30 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from sedimentary rocks, loess and volcanic ash

Dominant Present Vegetation

Hundraw: Indian ricegrass, black sagebrush

Peeko: Indian ricegrass, Thurber needlegrass, black sagebrush

Hundraw: Indian ricegrass, Thurber needlegrass, black sagebrush

Inclusion 1: Utah juniper, Wyoming big sagebrush

Inclusion 2: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Inclusion 3: Sandberg bluegrass, Thurber needlegrass, Wyoming big sagebrush

Ecological Site

Hundraw: 025XY060NV

Peeko: 024XY030NV

Hundraw: 024XY030NV

Inclusion 1: 025XY059NV

Inclusion 2: 024XY031NV

Inclusion 3: 025XY019NV

945--Hundraw-Izar-Izar, steep association

Composition

Major Components

Hundraw gravelly fine sandy loam, 15 to 50 percent slopes, eroded--45 percent

Izar very gravelly loam, 4 to 15 percent slopes--20 percent

Izar very gravelly loam, 15 to 50 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Aridic Haploxerolls, loamy, mixed, mesic, shallow very gravelly loam--10 percent

Inclusion 2: Kelk silt loam, 2 to 8 percent slopes--3 percent

Inclusion 3: Yuko very gravelly loam, 4 to 15 percent slopes--2 percent

Map Unit Setting

Landscape position: Hills

Hundraw--Landform: Hills; geomorphic position:

backslope; shape of slope: convex; aspect: south

Izar--Landform: Hills; geomorphic position: summit

Izar--Landform: Hills; geomorphic position:

backslope; shape of slope: plane; aspect: south

Inclusion 1--Landform: Hills; geomorphic position:

backslope; aspect: north

Inclusion 2--Landform: Drainageways

Inclusion 3--Landform: Hills; geomorphic position:

summit; position on slope: lower; shape of slope: concave

Major Component Description

Hundraw Series

Elevation: 5,400 to 6,200 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 30 percent gravel

Surface layer texture: Gravelly fine sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium

derived from sedimentary rocks, loess and volcanic ash

Izar Series

Elevation: 5,400 to 6,200 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 60 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Somewhat excessively drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Izar Series

Elevation: 5,400 to 6,200 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 60 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Somewhat excessively drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dominant Present Vegetation

Hundraw: Indian ricegrass, Utah juniper, black sagebrush
 Izar: Indian ricegrass, Thurber needlegrass, black sagebrush
 Izar: Indian ricegrass, Thurber needlegrass, black sagebrush
 Inclusion 1: Indian ricegrass, Thurber needlegrass, black sagebrush
 Inclusion 2: Sandberg bluegrass, Thurber needlegrass, Wyoming big sagebrush
 Inclusion 3: Thurber needlegrass, Wyoming big sagebrush, cheatgrass

Ecological Site

970--Hunewill-Bilbo-Devilsgait association

Composition

Major Components

Hunewill gravelly loam, 2 to 4 percent slopes--40 percent
 Bilbo very gravelly loam, 2 to 8 percent slopes--30 percent
 Devilsgait silt loam, drained, 2 to 4 percent slopes, rarely flooded--15 percent

Contrasting Inclusions

Inclusion 1: Kelk silt loam, 2 to 8 percent slopes--10 percent
 Inclusion 2: Durixerollic Camborthids, sandy-skeletal, mixed, mesic gravelly loam--3 percent
 Inclusion 3: Sonoma silt loam, drained, 0 to 2 percent slopes--2 percent

Map Unit Setting

Landscape position: Intermontane basins
 Hunewill--Landform: Inset fans; position on slope: lower
 Bilbo--Landform: Fan remnants; position on slope: upper
 Devilsgait--Landform: Flood plains
 Inclusion 1--Landform: Fan remnants; geomorphic position: backslope
 Inclusion 2--Landform: Inset fans
 Inclusion 3--Landform: Inset fans

Major Component Description

Hunewill Series

Elevation: 5,500 to 6,500 feet
Precipitation: About 8 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 15 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Bilbo Series

Elevation: 5,500 to 6,500 feet
Precipitation: About 8 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 30 percent cobbles; 30 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Devilsgait Series

Elevation: 5,500 to 6,500 feet
Precipitation: About 8 inches
Air temperature: About 46 degrees
Frost-free season: About 100 days
Surface layer texture: Silt loam
Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Hunewill: Wyoming big sagebrush, bluebunch wheatgrass, cheatgrass, phlox
 Bilbo: Wyoming big sagebrush, bluebunch wheatgrass, cheatgrass, phlox
 Devilsgait: Basin big sagebrush, basin wildrye
 Inclusion 1: Sandberg bluegrass, Thurber needlegrass, Wyoming big sagebrush
 Inclusion 2: Sandberg bluegrass, Thurber needlegrass, Wyoming big sagebrush
 Inclusion 3: Black greasewood, inland saltgrass

Ecological Site

1010--Agassiz-Croesus-Rubble land association

Composition

Major Components

Agassiz very gravelly loam, 30 to 70 percent slopes--40 percent

Croesus extremely stony loam, 30 to 75 percent slopes--25 percent

Rubble land fragmental material, 30 to 75 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Hackwood cobbly loam, 30 to 50 percent slopes--5 percent

Inclusion 2: Rock outcrop--5 percent

Inclusion 3: Belsac gravelly loam, 15 to 50 percent slopes--3 percent

Inclusion 4: Onkeyo very gravelly loam, 15 to 30 percent slopes--2 percent

Map Unit Setting

Landscape position: Mountains

Agassiz--Landform: Mountains; geomorphic position: backslope; shape of slope: convex; aspect: south

Croesus--Landform: Mountains; geomorphic position: backslope; aspect: north

Rubble land--Landform: Mountains; geomorphic position: backslope

Inclusion 1--Landform: Mountains; geomorphic position: backslope; shape of slope: concave; aspect: north

Inclusion 2--Landform: Mountains; geomorphic position: backslope

Inclusion 3--Landform: Mountains; geomorphic position: backslope; shape of slope: concave

Inclusion 4--Landform: Mountains; geomorphic position: summit; shape of slope: plane

Major Component Description

Agassiz Series

Elevation: 6,900 to 8,700 feet

Precipitation: About 16 inches

Air temperature: About 42 degrees

Frost-free season: About 65 days

Surface rock fragments: 10 percent cobbles; 55 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum derived from limestone and dolomite

Croesus Series

Elevation: 6,900 to 8,700 feet

Precipitation: About 18 inches

Air temperature: About 42 degrees

Frost-free season: About 70 days

Surface rock fragments: 15 percent cobbles; 40 percent gravel

Surface layer texture: Extremely stony loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Rubble land Miscellaneous Area

Elevation: 6,900 to 8,700 feet

Surface layer texture: Fragmental material

Drainage class: Excessively drained

Dominant Present Vegetation

Agassiz: Thurber needlegrass, bluebunch wheatgrass, curleaf mountainmahogany

Croesus: Idaho fescue, curleaf mountainmahogany, snowberry

Inclusion 1: Mountain brome, quaking aspen

Inclusion 2: None

Inclusion 3: Idaho fescue, mountain big sagebrush, snowberry

Inclusion 4: Idaho fescue, snowberry

Ecological Site

Agassiz: 028BY042NV

Croesus: 028BY042NV

Rubble land: None

Inclusion 1: 025XY065NV

Inclusion 2: none

Inclusion 3: 025XY004NV

Inclusion 4: 025XY042NV

1040--Gravier-Shafter-Toano association

Composition

Major Components

Gravier gravelly loam, 2 to 8 percent slopes--35 percent

Shafter gravelly loam, 2 to 8 percent slopes--30 percent

Toano silt loam, gravelly substratum, 2 to 8 percent slopes, occasionally flooded--20 percent

Contrasting Inclusions

Inclusion 1: Pibler very gravelly loam, 2 to 8 percent slopes--7 percent

Inclusion 2: Loray gravelly sandy loam, 2 to 8 percent slopes--5 percent

Inclusion 3: Wiffo gravelly loam, 2 to 8 percent slopes--3 percent

Map Unit Setting

Landscape position: Intermontane basins
 Gravier--Landform: Fan skirts
 Shafter--Landform: Fan remnants; shape of slope: plane
 Toano--Landform: Fan skirts; position on slope: lower; shape of slope: plane
 Inclusion 1--Landform: Fan remnants; position on slope: lower
 Inclusion 2--Landform: Spits
 Inclusion 3--Landform: Inset fans

Major Component Description**Gravier Series**

Elevation: 4,800 to 5,200 feet
Precipitation: About 7 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Shafter Series

Elevation: 4,800 to 5,200 feet
Precipitation: About 7 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 20 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from limestone and dolomite, loess and volcanic ash

Toano Series

Elevation: 4,800 to 5,200 feet
Precipitation: About 7 inches
Air temperature: About 47 degrees
Frost-free season: About 115 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Gravier: Indian ricegrass, shadscale, winterfat
 Shafter: Indian ricegrass, winterfat
 Toano: Indian ricegrass, winterfat
 Inclusion 1: Black sagebrush, needleandthread
 Inclusion 2: Shadscale
 Inclusion 3: Wyoming big sagebrush, bottlebrush squirreltail

Ecological Site

Gravier: 028AY002NV
 Shafter: 028AY002NV
 Toano: 028BY018NV
 Inclusion 1: 028BY011NV
 Inclusion 2: 028BY017NV
 Inclusion 3: 028BY010NV

1041--Gravier-Wiffo association**Composition****Major Components**

Gravier gravelly loam, 2 to 8 percent slopes--50 percent
 Wiffo very gravelly loam, 2 to 8 percent slopes--40 percent

Contrasting Inclusions

Inclusion 1: Wiffo Variant very stony loam, 4 to 15 percent slopes--4 percent
 Inclusion 2: Pibler very gravelly fine sandy loam, 2 to 8 percent slopes--3 percent
 Inclusion 3: Wiffo stony loam, 2 to 8 percent slopes--2 percent
 Inclusion 4: Gravier stony loam, 2 to 8 percent slopes--1 percent

Map Unit Setting

Landscape position: Fan piedmonts
 Gravier--Landform: Fan skirts
 Wiffo--Landform: Fan skirts
 Inclusion 1--Landform: Fan skirts; position on slope: upper
 Inclusion 2--Landform: Fan remnants; position on slope: lower
 Inclusion 3--Landform: Fan skirts
 Inclusion 4--Landform: Fan skirts; position on slope: lower

Major Component Description**Gravier Series**

Elevation: 4,900 to 5,200 feet
Precipitation: About 7 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Wiffo Series

Elevation: 4,900 to 5,200 feet
Precipitation: About 8 inches

Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 1 percent cobbles; 35 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Somewhat excessively drained
Dominant parent material: Alluvium derived from sedimentary rocks

Dominant Present Vegetation

Gravier: Indian ricegrass, shadscale, winterfat
 Wiffo: Indian ricegrass, Wyoming big sagebrush, needleandthread
 Inclusion 1: Bottlebrush squirreltail, spiny hopsage
 Inclusion 2: Indian ricegrass, black sagebrush
 Inclusion 3: Wyoming big sagebrush, needleandthread
 Inclusion 4: Indian ricegrass, shadscale, winterfat

Ecological Site

1042--Gravier-Pibler association

Composition

Major Components

Gravier very gravelly sandy loam, 2 to 8 percent slopes--60 percent
 Pibler very gravelly fine sandy loam, 2 to 8 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Izar very gravelly loam, 4 to 15 percent slopes--6 percent
 Inclusion 2: Wiffo very gravelly sandy loam, 2 to 8 percent slopes, occasionally flooded--5 percent
 Inclusion 3: Holborn very stony loam, 4 to 15 percent slopes--4 percent

Map Unit Setting

Landscape position: Intermontane basins
 Gravier--Landform: Fan skirts
 Pibler--Landform: Fan remnants; shape of slope: concave
 Inclusion 1--Landform: Hills; geomorphic position: backslope
 Inclusion 2--Landform: Hills; geomorphic position: backslope; aspect: north

Inclusion 3--Landform: Inset fans; position on slope: lower

Major Component Description

Gravier Series

Elevation: 5,200 to 5,600 feet
Precipitation: About 7 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Pibler Series

Elevation: 5,200 to 5,600 feet
Precipitation: About 8 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 50 percent gravel
Surface layer texture: Very gravelly fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Gravier: Indian ricegrass, shadscale, winterfat
 Pibler: Indian ricegrass, black sagebrush, needleandthread
 Inclusion 1: Indian ricegrass, black sagebrush
 Inclusion 2: Wyoming big sagebrush, spiny hopsage
 Inclusion 3: Black sagebrush, bluebunch wheatgrass

Ecological Site

 Inclusion 2--Landform: Inset fans
 Inclusion 3--Landform: Inset fans
 Inclusion 4--Landform: Fan remnants; geomorphic position: summit; shape of slope: plane

Major Component Description

Pibler Series

Elevation: 5,100 to 5,400 feet
Precipitation: About 9 inches
Air temperature: About 52 degrees
Frost-free season: About 110 days
Surface rock fragments: 50 percent gravel
Surface layer texture: Very gravelly fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Pibler Series

Elevation: 5,100 to 5,400 feet
Precipitation: About 9 inches
Air temperature: About 52 degrees
Frost-free season: About 110 days
Surface rock fragments: 50 percent gravel

Surface layer texture: Gravelly silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Izar Series

Elevation: 5,100 to 5,400 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 60 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Somewhat excessively drained
Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Dominant Present Vegetation

Pibler: Indian ricegrass, black sagebrush, bottlebrush squirreltail
 Pibler: Indian ricegrass, black sagebrush, needleandthread
 Izar: Indian ricegrass, black sagebrush, bottlebrush squirreltail
 Inclusion 1: Indian ricegrass, black sagebrush, bluebunch wheatgrass
 Inclusion 2: Indian ricegrass, bluegrass, winterfat
 Inclusion 3: Wyoming big sagebrush, bottlebrush squirreltail
 Inclusion 4: Wyoming big sagebrush, bottlebrush squirreltail

Ecological Site

 position: summit

Major Component Description

Kzin Series

Elevation: 5,600 to 6,200 feet
Precipitation: About 10 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface rock fragments: 5 percent cobbles; 35
 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum derived from
 sedimentary rocks

Cobre Series

Elevation: 5,600 to 6,200 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium
 derived from pyroclastic and extrusive volcanic
 rocks

Jackpot Series

Elevation: 5,600 to 6,200 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface layer texture: Sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium
 derived from tuffaceous rocks

Dominant Present Vegetation

Kzin: Utah juniper, black sagebrush, singleleaf
 pinyon
 Cobre: Indian ricegrass, Wyoming big sagebrush,
 needleandthread
 Jackpot: Indian ricegrass, Wyoming big sagebrush,
 needleandthread
 Inclusion 1: Bottlebrush squirreltail, fourwing
 saltbush, spiny hopsage
 Inclusion 2: Black sagebrush, juniper

Inclusion 3: Indian ricegrass, black sagebrush
 Inclusion 4: None

Major Component Description

Loray Series

Elevation: 4,900 to 5,200 feet
Precipitation: About 7 inches
Air temperature: About 47 degrees
Frost-free season: About 115 days
Surface rock fragments: 50 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Somewhat excessively drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Luap Series

Elevation: 4,900 to 5,200 feet
Precipitation: About 7 inches
Air temperature: About 47 degrees
Frost-free season: About 115 days
Surface rock fragments: 45 percent gravel

Surface layer texture: Very gravelly fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Toano Series

Elevation: 4,900 to 5,200 feet
Precipitation: About 7 inches
Air temperature: About 47 degrees
Frost-free season: About 115 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Loray: Indian ricegrass, bud sagebrush, shadscale
 Luap: Indian ricegrass, bud sagebrush, shadscale
 Toano: Indian ricegrass, bottlebrush squirreltail, winterfat
 Inclusion 1: Indian ricegrass, winterfat
 Inclusion 2: Fourwing saltbush, spiny hopsage
 Inclusion 3: Fourwing saltbush, spiny hopsage
 Inclusion 4: Indian ricegrass, winterfat

backslope

Major Component Description

Xerxes Series

Elevation: 5,200 to 5,400 feet

Precipitation: About 12 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 10 percent stones and
boulders; 20 percent cobbles; 45 percent gravel

Surface layer texture: Extremely cobbly loamy sand

Drainage class: Well drained

Dominant parent material: Residuum and colluvium
derived from volcanic rocks, loess and volcanic
ash

Bluehill Series

Elevation: 5,200 to 5,400 feet

Precipitation: About 12 inches

Air temperature: About 47 degrees

Frost-free season: About 105 days

Surface rock fragments: 5 percent gravel

Surface layer texture: Fine sandy loam

Drainage class: Somewhat excessively drained

Dominant parent material: Residuum and alluvium
derived from volcanic ash

Dominant Present Vegetation

Xerxes: Wyoming big sagebrush, bluebunch
wheatgrass

Bluehill: Wyoming big sagebrush, bluebunch
wheatgrass, needleandthread

Inclusion 1: Indian ricegrass, Utah juniper, black
sagebrush

Inclusion 2: Thurber needlegrass, big sagebrush,
cheatgrass

Inclusion 3: Bluebunch wheatgrass, low sagebrush

Inclusion 4: Indian ricegrass, black sagebrush

Ecological Site

Xerxes: 025XY021NV

Bluehill: 025XY066NV

Inclusion 3: 025XY018NV

Inclusion 4: 024XY030NV

1201--Xerxes-Zark-Ashart association

Composition

Major Components

Xerxes very cobbly sandy loam, 15 to 30 percent
slopes--35 percent

Zark loamy fine sand, 2 to 8 percent slopes--25
percent

Ashart sandy loam, 4 to 15 percent slopes--25
percent

Contrasting Inclusions

Inclusion 1: Shalper very gravelly loam, 2 to 8
percent slopes--6 percent

Inclusion 2: Shalper very gravelly loam, 15 to 30
percent slopes--5 percent

Inclusion 3: Hundraw gravelly fine sandy loam, 15
to 30 percent slopes--3 percent

Inclusion 4: Welch silt loam, drained, 0 to 2 percent
slopes, rarely flooded--1 percent

Map Unit Setting

Landscape position: Hills

Xerxes--Landform: Hills; geomorphic position:
backslope; shape of slope: convex

Zark--Landform: Hills; geomorphic position: summit;
position on slope: lower; shape of slope: plane

Ashart--Landform: Hills; geomorphic position:
backslope; position on slope: lower

Inclusion 1--Landform: Hills; geomorphic position:
summit; position on slope: upper

Inclusion 2--Landform: Hills; geomorphic position:
backslope

Inclusion 3--Landform: Hills; geomorphic position:
backslope; aspect: south

Inclusion 4--Landform: Drainageways

Major Component Description

Xerxes Series

Elevation: 5,400 to 5,800 feet

Precipitation: About 12 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 15 percent cobbles; 25
percent gravel

Surface layer texture: Very cobbly sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium
derived from volcanic rocks, loess and volcanic
ash

Zark Series

Elevation: 5,400 to 5,800 feet

Precipitation: About 11 inches

Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface layer texture: Loamy fine sand
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Ashart Series

Elevation: 5,400 to 5,800 feet
Precipitation: About 11 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dominant Present Vegetation

Xerxes: Wyoming big sagebrush, bluebunch wheatgrass
 Zark: Indian ricegrass, Wyoming big sagebrush, needleandthread
 Ashart: Indian ricegrass, Nevada bluegrass, Wyoming big sagebrush
 Inclusion 1: Bluebunch wheatgrass
 Inclusion 2: Bluebunch wheatgrass
 Inclusion 3: Utah juniper, black sagebrush
 Inclusion 4: Basin big sagebrush, basin wildrye

Ecological Site

Xerxes: 025XY021NV
 Zark: 025XY045NV
 Ashart: 025XY066NV
 Inclusion 1: 025XY021NV
 Inclusion 2: 025XY021NV
 Inclusion 3: 025XY060NV
 Inclusion 4: 025XY003NV

1203--Xerxes, moderately steep-Xerxes-Shalper association

Composition

Major Components

Xerxes very cobbly sandy loam, 15 to 30 percent slopes--35 percent
 Xerxes extremely cobbly loamy sand, 4 to 15 percent slopes--30 percent
 Shalper very gravelly loam, 2 to 8 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Shalcleav very gravelly silt loam, 4 to 15 percent slopes--10 percent

Inclusion 2: Sumine very gravelly loam, 15 to 30 percent slopes--2 percent
 Inclusion 3: Welch silt loam, 0 to 2 percent slopes, rarely flooded--2 percent
 Inclusion 4: Rock outcrop--1 percent

Map Unit Setting

Landscape position: Hills
 Xerxes--Landform: Hills; geomorphic position: backslope; position on slope: upper; shape of slope: convex
 Xerxes--Landform: Hills; geomorphic position: backslope; position on slope: lower; shape of slope: concave
 Shalper--Landform: Hills; geomorphic position: summit; shape of slope: convex

 Inclusion 2--Landform: Hills; geomorphic position: backslope; shape of slope: concave; aspect: south
 Inclusion 3--Landform: Drainageways
 Inclusion 4--Landform: Hills; geomorphic position: backslope

Major Component Description

Xerxes Series

Elevation: 5,500 to 5,900 feet
Precipitation: About 12 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 15 percent cobbles; 25 percent gravel
Surface layer texture: Very cobbly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks, loess and volcanic ash

Xerxes Series

Elevation: 5,500 to 5,900 feet
Precipitation: About 12 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 15 percent cobbles; 25 percent gravel
Surface layer texture: Extremely cobbly loamy sand
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks, loess and volcanic ash

Shalper Series

Elevation: 5,500 to 5,900 feet

Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 85 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Xerxes: Wyoming big sagebrush, bluebunch wheatgrass
 Xerxes: Wyoming big sagebrush, bluebunch wheatgrass
 Shalper: Wyoming big sagebrush, bluebunch wheatgrass
 Inclusion 1: Thurber needlegrass, black sagebrush
 Inclusion 2: Basin wildrye, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 3: Nevada bluegrass, basin big sagebrush, basin wildrye
 Inclusion 4: None

Ecological Site

Xerxes: 025XY021NV

 Inclusion 3--Landform: Hills; geomorphic position: summit

Major Component Description

Xerxes Series

Elevation: 5,300 to 6,200 feet
Precipitation: About 12 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 15 percent cobbles; 25 percent gravel
Surface layer texture: Very cobbly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks, loess and volcanic ash

Shalper Series

Elevation: 5,300 to 6,200 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 85 days
Surface rock fragments: 45 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Bluehill Series

Elevation: 5,300 to 6,200 feet
Precipitation: About 14 inches
Air temperature: About 47 degrees
Frost-free season: About 105 days
Surface rock fragments: 5 percent gravel
Surface layer texture: Fine sandy loam
Drainage class: Somewhat excessively drained
Dominant parent material: Residuum and alluvium derived from volcanic ash

Dominant Present Vegetation

Xerxes: Wyoming big sagebrush, bluebunch wheatgrass
 Shalper: Wyoming big sagebrush, bluebunch wheatgrass

Bluehill: Indian ricegrass, Nevada bluegrass,
Wyoming big sagebrush
Inclusion 1: Utah juniper
Inclusion 2: Wyoming big sagebrush, bottlebrush
squirreltail
Inclusion 3: Thurber needlegrass, black sagebrush

Ecological Site

Xerxes: 025XY021NV
Shalper: 025XY021NV
Bluehill: 025XY066NV

Inclusion 3: 025XY057NV

1400--Nevador-Zapa association

Composition

Major Components

Nevador gravelly loam, 4 to 15 percent slopes--55 percent
Zapa very gravelly silt loam, 15 to 30 percent slopes--30 percent

Contrasting Inclusions

Inclusion 1: Ackett very gravelly clay loam, 4 to 15 percent slopes--5 percent
Inclusion 2: Hunewill gravelly silt loam, 2 to 8 percent slopes--5 percent
Inclusion 3: Wieland very gravelly loam, 2 to 8 percent slopes--3 percent
Inclusion 4: Rodie very gravelly loam, 15 to 30 percent slopes--2 percent

Map Unit Setting

Landscape position: Fan piedmonts
Nevador--Landform: Fan remnants; geomorphic position: summit; position on slope: lower; shape of slope: concave
Zapa--Landform: Fan remnants; geomorphic position: summit
Inclusion 1--Landform: Fan remnants; geomorphic position: summit; shape of slope: plane
Inclusion 2--Landform: Fan remnants; geomorphic position: summit; shape of slope: convex
Inclusion 3--Landform: Fan remnants; geomorphic position: summit; shape of slope: concave
Inclusion 4--Landform: Hills; geomorphic position: backslope; position on slope: lower; shape of slope: concave

Major Component Description

Nevador Series

Elevation: 5,000 to 6,300 feet

Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 115 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Zapa Series

Elevation: 5,000 to 6,300 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 55 percent gravel
Surface layer texture: Very gravelly silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Nevador: Thurber needlegrass, Wyoming big sagebrush, bluebunch wheatgrass
Zapa: Indian ricegrass, Thurber needlegrass, black sagebrush
Inclusion 1: Indian ricegrass, black sagebrush
Inclusion 2: Thurber needlegrass, Wyoming big sagebrush
Inclusion 3: Thurber needlegrass, Wyoming big sagebrush
Inclusion 4: Black sagebrush, bluebunch wheatgrass

Ecological Site

Nevador: 025XY019NV

Inclusion 4: 025XY055NV

2000--Shuttle-Shafter-Loray association

Composition

Major Components

Shuttle silt loam, 2 to 8 percent slopes--30 percent
Shafter gravelly loam, 2 to 8 percent slopes--30 percent
Loray gravelly loam, 8 to 30 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Toano silt loam, 2 to 8 percent slopes--

5 percent

Inclusion 2: Pibler very gravelly loam, 2 to 8 percent slopes--5 percent

Inclusion 3: Gravier gravelly loam, 2 to 8 percent slopes--5 percent

Map Unit Setting

Landscape position: Intermontane basins

Shuttle--Landform: Fan skirts

Shafter--Landform: Fan remnants; geomorphic position: summit

Loray--Landform: Spits; geomorphic position: backslope

Inclusion 1--Landform: Fan skirts; shape of slope: plane

Inclusion 2--Landform: Fan remnants; geomorphic position: summit

Inclusion 3--Landform: Fan skirts; shape of slope: concave

Major Component Description

Shuttle Series

Elevation: 4,900 to 5,200 feet

Precipitation: About 6 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 20 percent gravel

Surface layer texture: Silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks

Shafter Series

Elevation: 4,900 to 5,200 feet

Precipitation: About 7 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 20 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from limestone and dolomite, loess and volcanic ash

Loray Series

Elevation: 4,900 to 5,200 feet

Precipitation: About 6 inches

Air temperature: About 47 degrees

Frost-free season: About 115 days

Surface rock fragments: 50 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Somewhat excessively drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Shuttle: Indian ricegrass, bottlebrush squirreltail, winterfat

Shafter: Indian ricegrass, bluegrass, winterfat

Loray: Indian ricegrass, bud sagebrush, needleandthread, shadscale

Inclusion 1: Indian ricegrass, winterfat

Inclusion 2: Black sagebrush, bottlebrush squirreltail

Inclusion 3: Indian ricegrass, winterfat

Ecological Site

Shuttle: 028BY018NV

Loray: 028BY017NV

Inclusion 1: 028BY018NV

Inclusion 2: 028BY011NV

Inclusion 3: 028BY013NV

2001--Shuttle-Hardhat-Shuttle, loamy substratum association

Composition

Major Components

Shuttle silt loam, 2 to 8 percent slopes--40 percent

Hardhat silt loam, 2 to 8 percent slopes--30 percent

Shuttle silt loam, loamy substratum, 2 to 8 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Shafter gravelly loam, 2 to 8 percent slopes--5 percent

Inclusion 2: Loray gravelly loam, 8 to 30 percent slopes--5 percent

Inclusion 3: Toano silt loam, 2 to 8 percent slopes, occasionally flooded--5 percent

Map Unit Setting

Landscape position: Fan piedmonts

Shuttle--Landform: Fan skirts; position on slope: upper; shape of slope: plane

Hardhat--Landform: Fan skirts; position on slope: lower

Shuttle--Landform: Fan skirts; position on slope: lower

Inclusion 1--Landform: Spits; geomorphic position: summit

Inclusion 2--Landform: Spits; geomorphic position: backslope

Inclusion 3--Landform: Fan skirts; position on slope: lower

Major Component Description

Shuttle Series

Elevation: 4,800 to 5,300 feet

Precipitation: About 6 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 20 percent gravel

Surface layer texture: Silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks

Hardhat Series

Elevation: 4,800 to 5,300 feet

Precipitation: About 6 inches

Air temperature: About 49 degrees

Frost-free season: About 110 days

Surface layer texture: Silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks over lacustrine sediments

Shuttle Series

Elevation: 4,800 to 5,300 feet

Precipitation: About 6 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface rock fragments: 20 percent gravel

Surface layer texture: Silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Shuttle: Indian ricegrass, bottlebrush squirreltail, winterfat

Hardhat: Indian ricegrass, bottlebrush squirreltail, shadscale

Shuttle: Indian ricegrass, bottlebrush squirreltail, winterfat

Inclusion 1: Sandberg bluegrass, winterfat

2010--Wiffo Variant extremely stony sandy loam, 2 to 8 percent slopes, rarely flooded

Composition

Major Components

Wiffo Variant extremely stony sandy loam, 2 to 8 percent slopes, rarely flooded--85 percent

Contrasting Inclusions

Inclusion 1: Sodhouse gravelly loam, 2 to 8 percent slopes--6 percent

Inclusion 2: Xeric Torriorthents, loamy-skeletal, mixed (calcareous), mesic gravelly silt loam--6 percent

Inclusion 3: Izar very cobbly loam, 4 to 15 percent slopes--3 percent

Map Unit Setting

Landscape position: Fan piedmonts

Wiffo Variant--Landform: Alluvial fans

Inclusion 1--Landform: Alluvial fans; position on slope: lower

Inclusion 2--Landform: Inset fans

Inclusion 3--Landform: Pediments

Major Component Description

Wiffo Variant

Elevation: 5,100 to 5,900 feet

Precipitation: About 9 inches

Air temperature: About 48 degrees

Frost-free season: About 110 days

Surface rock fragments: 5 percent stones and boulders; 5 percent cobbles; 10 percent gravel

Surface layer texture: Extremely stony sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Wiffo Variant: Indian ricegrass, Wyoming big sagebrush, spiny hopsage

Inclusion 1: Indian ricegrass, shadscale

Inclusion 2: Indian ricegrass, Wyoming big sagebrush

Inclusion 3: Indian ricegrass, black sagebrush

Ecological Site

2051--Hopeka-Kzin-Rock outcrop association

Composition

Major Components

Hopeka very gravelly loam, 15 to 50 percent slopes--50 percent
 Kzin very gravelly loam, 15 to 50 percent slopes--20 percent
 Rock outcrop--15 percent

Contrasting Inclusions

- Inclusion 1: Rubble land--5 percent
 Inclusion 2: Tecomar very gravelly silt loam, 15 to 50 percent slopes--4 percent
 Inclusion 3: Ekim very cobbly loam, 15 to 50 percent slopes--4 percent
 Inclusion 4: Torrifluventic Haploxerolls, loamy-skeletal, mixed, mesic sandy loam--2 percent

Map Unit Setting

- Landscape position:* Mountains
 Hopeka--Landform: Mountains; geomorphic position: backslope; position on slope: upper; shape of slope: convex
 Kzin--Landform: Mountains; geomorphic position: backslope; position on slope: lower; shape of slope: concave
 Rock outcrop--Landform: Mountains; geomorphic position: summit
 Inclusion 1--Landform: Mountains; geomorphic position: backslope
 Inclusion 2--Landform: Mountains; geomorphic position: backslope; aspect: north
 Inclusion 3--Landform: Mountains; geomorphic position: backslope; aspect: south
 Inclusion 4--Landform: Drainageways; geomorphic position: backslope; position on slope: lower; shape of slope: concave

Major Component Description**Hopeka Series**

- Elevation:* 5,500 to 7,600 feet
Precipitation: About 12 inches
Air temperature: About 43 degrees
Frost-free season: About 85 days
Surface rock fragments: 10 percent cobbles; 50 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Kzin Series

- Elevation:* 5,500 to 7,600 feet
Precipitation: About 12 inches
Air temperature: About 47 degrees
Frost-free season: About 90 days
Surface rock fragments: 35 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum derived from sedimentary rocks

Rock outcrop Miscellaneous Area

Elevation: 5,500 to 7,600 feet

Dominant Present Vegetation

- Hopeka: Utah juniper, black sagebrush, bluebunch wheatgrass, singleleaf pinyon
 Kzin: Utah juniper, black sagebrush, bluebunch wheatgrass, singleleaf pinyon
 Rock outcrop: None
 Inclusion 1: None
 Inclusion 2: Black sagebrush, bluebunch wheatgrass
 Inclusion 3: Antelope bitterbrush, mountain big sagebrush
 Inclusion 4: Indian ricegrass, big sagebrush

Ecological Site

- Hopeka: 028BY060NV
 Kzin: 028BY060NV
 Rock outcrop: None
 Inclusion 1: none
 Inclusion 2: 024XY031NV
 Inclusion 3: 025XY009NV
 Inclusion 4: 028BY007NV

2053--Hopeka-Tecomar-Nirac association**Composition****Major Components**

- Hopeka very gravelly loam, 15 to 50 percent slopes--35 percent
 Tecomar extremely gravelly loam, 15 to 50 percent slopes--30 percent
 Nirac gravelly silt loam, 8 to 30 percent slopes--20 percent

Contrasting Inclusions

- Inclusion 1: Onkeyo very gravelly silty clay loam, 8 to 30 percent slopes--5 percent
 Inclusion 2: Gollaher extremely gravelly loam, 15 to 50 percent slopes--4 percent
 Inclusion 3: Rock outcrop--3 percent
 Inclusion 4: Aridic Calcixerolls, loamy-skeletal, mixed, frigid very gravelly loam--3 percent

Map Unit Setting

- Landscape position:* Mountains

Inclusion 1--Landform: Mountains; geomorphic position: backslope; position on slope: upper; shape of slope: convex
 Inclusion 2--Landform: Mountains; geomorphic position: summit; position on slope: upper
 Inclusion 3--Landform: Mountains
 Inclusion 4--Landform: Mountains; geomorphic position: backslope; position on slope: lower

Major Component Description

Hopeka Series

Elevation: 6,200 to 7,300 feet
Precipitation: About 12 inches
Air temperature: About 43 degrees
Frost-free season: About 85 days
Surface rock fragments: 10 percent cobbles; 50 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Tecomar Series

Elevation: 6,200 to 7,300 feet
Precipitation: About 12 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface rock fragments: 10 percent cobbles; 45 percent gravel
Surface layer texture: Extremely gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Nirac Series

Elevation: 6,200 to 7,300 feet
Precipitation: About 12 inches
Air temperature: About 43 degrees
Frost-free season: About 90 days
Surface rock fragments: 20 percent gravel
Surface layer texture: Gravelly silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Dominant Present Vegetation

Hopeka: Utah juniper, black sagebrush, bluebunch wheatgrass, singleleaf pinyon
 Tecomar: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Nirac: Antelope bitterbrush, bluebunch wheatgrass
 Inclusion 1: Bluebunch wheatgrass

Inclusion 2: Thurber needlegrass, black sagebrush
 Inclusion 3: None
 Inclusion 4: Thurber needlegrass, big sagebrush

Ecological Site

2060--Appian-Kawich, fine sand-Kawich association

Composition

Major Components

Appian fine sandy loam, 0 to 2 percent slopes--50 percent

Kawich fine sand, 8 to 30 percent slopes--25 percent

Kawich sandy loam, 2 to 4 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Typic Torripsamments, mixed, mesic loamy sand--5 percent

Inclusion 2: Typic Torripsamments, mixed, mesic loamy sand--4 percent

Inclusion 3: Sondoia silt loam, strongly saline-alkali, 4 to 15 percent slopes--1 percent

Map Unit Setting

Landscape position: Intermontane basins

Appian--Landform: Lake plains; position on slope: lower

Kawich--Landform: Dunes

Kawich--Landform: Sand sheets

Inclusion 1--Landform: Lake plains; geomorphic position: backslope

Inclusion 2--Landform: Lake terraces

Inclusion 3--Landform: Lake plains; geomorphic position: backslope

Major Component Description

Appian Series

Elevation: 4,700 to 5,000 feet

Precipitation: About 6 inches

Air temperature: About 52 degrees

Frost-free season: About 110 days

Surface layer texture: Fine sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks and lacustrine sediments

Kawich Series

Elevation: 4,700 to 5,000 feet

Precipitation: About 6 inches

Air temperature: About 52 degrees

Frost-free season: About 110 days

Surface layer texture: Fine sand

Drainage class: Excessively drained

Dominant parent material: Eolian sand

Kawich Series

Elevation: 4,700 to 5,000 feet

Precipitation: About 6 inches

Air temperature: About 52 degrees

Frost-free season: About 110 days

Surface layer texture: Sandy loam

Drainage class: Excessively drained

Dominant parent material: Eolian sand

Dominant Present Vegetation

Appian: Wyoming big sagebrush, basin wildrye, black greasewood

Kawich: Indian ricegrass, black greasewood, fourwing saltbush, spiny hopsage

Kawich: Wyoming big sagebrush, basin wildrye, black greasewood

Inclusion 1: Basin wildrye, big sagebrush, black greasewood

Inclusion 2: Basin wildrye, big sagebrush, black greasewood

Inclusion 3: Sickie saltbush

Ecological Site

Inclusion 2: 028BY028NV

Inclusion 3: 028BY047NV

2070--Kawich-Kawich, fine sand-Ixian association

Composition

Major Components

Kawich sandy loam, 2 to 4 percent slopes--45 percent

Kawich fine sand, 8 to 50 percent slopes--25 percent

Ixian silt loam, rarely flooded, 0 to 2 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Typic Torriorthents, fine-silty, mixed (calcareous), mesic silt loam--8 percent

Inclusion 2: Typic Torriorthents, coarse-loamy, mixed (calcareous), mesic sandy loam--4 percent

Inclusion 3: Typic Torriorthents, fine-silty, mixed (calcareous), mesic silt loam--2 percent

Inclusion 4: Ocala silt loam, 0 to 2 percent slopes, rarely flooded--1 percent

Map Unit Setting

Landscape position: Intermontane basins

Kawich--Landform: Sand sheets

Kawich--Landform: Dunes

Ixian--Landform: Lake plains

Inclusion 1--Landform: Lake plains

Inclusion 2--Landform: Fan skirts

Inclusion 3--Landform: Lake plains; geomorphic position: backslope

Inclusion 4--Landform: Alluvial flats

Major Component Description

Kawich Series

Elevation: 4,700 to 4,900 feet

Precipitation: About 6 inches

Air temperature: About 52 degrees

Frost-free season: About 110 days

Surface layer texture: Sandy loam

Drainage class: Excessively drained

Dominant parent material: Eolian sand

Kawich Series

Elevation: 4,700 to 4,900 feet

Precipitation: About 6 inches

Air temperature: About 52 degrees

Frost-free season: About 110 days

Surface layer texture: Fine sand

Drainage class: Excessively drained

Dominant parent material: Eolian sand

Ixian Series

Elevation: 4,700 to 4,900 feet

Precipitation: About 6 inches

Air temperature: About 52 degrees

Frost-free season: About 110 days

Surface layer texture: Silt loam

Drainage class: Somewhat poorly drained

Dominant parent material: Alluvium derived from mixed rocks over lacustrine sediments

Dominant Present Vegetation

Kawich: Wyoming big sagebrush, basin wildrye, black greasewood

Kawich: Indian ricegrass, alkali sacaton, black greasewood, fourwing saltbush

Ixian: Alkali sacaton, black greasewood, inland saltgrass

Inclusion 1: Basin wildrye, big sagebrush, black greasewood

Inclusion 2: Basin wildrye, big sagebrush, black greasewood

Inclusion 3: Black greasewood, bud sagebrush, shadscale

Inclusion 4: Alkali sacaton, black greasewood

Ecological Site

Kawich: 028BY028NV

Inclusion 3: 028BY074NV

Inclusion 4: 028BY004NV

2080--Toano-Toano, occasionally flooded association

Composition

Major Components

Toano silt loam, 2 to 4 percent slopes--70 percent

Toano silt loam, gravelly substratum, 2 to 4 percent slopes, occasionally flooded--20 percent

Contrasting Inclusions

Inclusion 1: Gravier gravelly loam, 2 to 4 percent slopes--4 percent

Inclusion 2: Xeric Torripsamments, mixed, mesic loamy fine sand--3 percent

Inclusion 3: Sondoia silt loam, 0 to 2 percent slopes--2 percent

Inclusion 4: Wiffo very gravelly sandy loam, 2 to 8 percent slopes--1 percent

Map Unit Setting

Landscape position: Intermontane basins

Toano--Landform: Fan skirts; geomorphic position: backslope; position on slope: lower

Toano--Landform: Fan skirts; position on slope: lower

Inclusion 1--Landform: Fan skirts; geomorphic position: backslope; position on slope: lower

Inclusion 2--Landform: Alluvial fans

Inclusion 3--Landform: Lake plains

Inclusion 4--Landform: Fan skirts; position on slope: upper

Major Component Description

Toano Series

Elevation: 4,850 to 5,000 feet

Precipitation: About 7 inches

Air temperature: About 47 degrees

Frost-free season: About 115 days

Surface layer texture: Silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Toano Series

Elevation: 4,850 to 5,000 feet

Precipitation: About 7 inches

Air temperature: About 47 degrees

Frost-free season: About 115 days

Surface layer texture: Silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Toano: Sickie saltbush

Toano: Indian ricegrass, winterfat

Inclusion 1: Indian ricegrass, bud sagebrush, winterfat

Inclusion 2: Wyoming big sagebrush, bottlebrush squirreltail, needleandthread

Inclusion 3: Alkali sacaton, black greasewood, inland saltgrass

Inclusion 4: Wyoming big sagebrush, bottlebrush squirreltail, needleandthread

2081--Toano-Tulase association

Composition

Major Components

Toano silt loam, 0 to 2 percent slopes, rarely flooded--55 percent

Tulase very fine sandy loam, 0 to 2 percent slopes, occasionally flooded--35 percent

Contrasting Inclusions

Inclusion 1: Wiffo very gravelly loam, 2 to 4 percent slopes--5 percent

Inclusion 2: Toano very fine sandy loam, 2 to 4 percent slopes, occasionally flooded--5 percent

Map Unit Setting

Landscape position: Intermontane basins

Toano--Landform: Drainageways

Tulase--Landform: Inset fans

Inclusion 1--Landform: Inset fans

Inclusion 2--Landform: Stream terraces

Major Component Description

Toano Series

Elevation: 4,850 to 5,900 feet

Precipitation: About 8 inches

Air temperature: About 47 degrees

Frost-free season: About 110 days

Surface layer texture: Silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Tulase Series

Elevation: 4,850 to 5,900 feet

Precipitation: About 8 inches

Air temperature: About 48 degrees

Frost-free season: About 110 days

Surface layer texture: Very fine sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Toano: Indian ricegrass

Tulase: Thurber needlegrass, Wyoming big sagebrush, bluebunch wheatgrass

Inclusion 1: Thurber needlegrass, Wyoming big sagebrush, bottlebrush squirreltail

Inclusion 2: Indian ricegrass, winterfat

Ecological Site

Toano: 028BY047NV

 Enko--Landform: Fan skirts; position on slope: lower
 Sondoa--Landform: Lake plains
 Inclusion 1--Landform: Lake plains
 Inclusion 2--Landform: Lake plains; geomorphic position: backslope; shape of slope: concave

Major Component Description**Toano Series**

Elevation: 4,700 to 4,900 feet
Precipitation: About 8 inches
Air temperature: About 47 degrees
Frost-free season: About 115 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Enko Series

Elevation: 4,700 to 4,900 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 110 days
Surface rock fragments: 2 percent gravel
Surface layer texture: Sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Sondoa Series

Elevation: 4,700 to 4,900 feet
Precipitation: About 8 inches
Air temperature: About 48 degrees
Frost-free season: About 115 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks and lacustrine sediments

Dominant Present Vegetation

Toano: Indian ricegrass, bottlebrush squirreltail, winterfat
 Enko: Indian ricegrass, Wyoming big sagebrush, needleandthread
 Sondoa: Indian ricegrass, bottlebrush squirreltail, sickle saltbush
 Inclusion 1: Indian ricegrass, bud sagebrush, shadscale
 Inclusion 2: Indian ricegrass, black sagebrush

Ecological Site

Toano: 028BY018NV

 Inclusion 2--Landform: Mountains; geomorphic position: backslope; position on slope: lower; shape of slope: concave
 Inclusion 3--Landform: Mountains; geomorphic position: summit

Major Component Description

Tecomar Series

Elevation: 6,000 to 6,900 feet
Precipitation: About 12 inches
Air temperature: About 47 degrees
Frost-free season: About 95 days
Surface rock fragments: 5 percent stones and boulders; 10 percent cobbles; 45 percent gravel
Surface layer texture: Extremely gravelly silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Sumine Series

Elevation: 6,000 to 6,900 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 60 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from quartzite

Kram Series

Elevation: 6,000 to 6,900 feet
Precipitation: About 11 inches
Air temperature: About 46 degrees
Frost-free season: About 90 days
Surface rock fragments: 65 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Dominant Present Vegetation

Tecomar: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Sumine: Antelope bitterbrush, bluebunch wheatgrass

Kram: Indian ricegrass, Utah juniper, black sagebrush

Inclusion 1: Bluebunch wheatgrass, mountain big sagebrush

Inclusion 2: Thurber needlegrass, big sagebrush, cheatgrass

Inclusion 3: None

Ecological Site

Tecomar: 024XY031NV

Sumine: 025XY009NV

Inclusion 3--Landform: Hills; geomorphic position: backslope; shape of slope: convex; aspect: south

Inclusion 4--Landform: Hills; geomorphic position: backslope; shape of slope: plane; aspect: north

Major Component Description

Tecomar Series

Elevation: 6,400 to 7,700 feet

Precipitation: About 12 inches

Air temperature: About 44 degrees

Frost-free season: About 100 days

Surface rock fragments: 5 percent stones and

boulders; 10 percent cobbles; 45 percent gravel

Surface layer texture: Extremely gravelly silt loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Shalclev Series

Elevation: 6,400 to 7,700 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 5 percent cobbles; 60

percent gravel

Surface layer texture: Extremely gravelly silt loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Gollaher Series

Elevation: 6,400 to 7,700 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 5 percent cobbles; 50

percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Dominant Present Vegetation

Tecomar: Black sagebrush, bluebunch wheatgrass

Shalclev: Indian ricegrass, Thurber needlegrass, black sagebrush

Gollaher: Thurber needlegrass, black sagebrush

Inclusion 1: Bluebunch wheatgrass, low sagebrush

Inclusion 2: Idaho fescue, snowberry

Inclusion 3: Antelope bitterbrush, bluebunch

wheatgrass, mountain big sagebrush

Inclusion 4: California brome, slender wheatgrass,

snowberry

Ecological Site

 Inclusion 1--Landform: Mountains; geomorphic position: backslope; position on slope: lower
 Inclusion 2--Landform: Mountains
 Inclusion 3--Landform: Mountains; geomorphic position: backslope; shape of slope: convex; aspect: north

Major Component Description

Tecomar Series

Elevation: 6,100 to 7,900 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 100 days
Surface rock fragments: 30 percent stones and boulders; 10 percent cobbles; 30 percent gravel
Surface layer texture: Extremely stony silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Hopeka Series

Elevation: 6,100 to 7,900 feet
Precipitation: About 14 inches
Air temperature: About 43 degrees
Frost-free season: About 90 days
Surface rock fragments: 10 percent cobbles; 50 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Gollaher Series

Elevation: 6,100 to 7,900 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 50 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Dominant Present Vegetation

Tecomar: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Hopeka: Utah juniper, black sagebrush, bluebunch wheatgrass, singleleaf pinyon
 Gollaher: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Inclusion 1: Utah juniper, black sagebrush, singleleaf pinyon
 Inclusion 2: None
 Inclusion 3: Idaho fescue, snowberry

Ecological Site

Tecomar: 024XY031NV

 Inclusion 2: none
 Inclusion 3: 025XY042NV

3012--Tecomar-Kram-Amtoft association

Composition

Major Components

Tecomar extremely stony silt loam, 15 to 50 percent slopes--40 percent
 Kram very gravelly loam, 15 to 50 percent slopes--30 percent

Amtoft extremely stony loam, 15 to 50 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Rock outcrop--3 percent

Inclusion 2: Soughe very stony loam, 15 to 50 percent slopes--5 percent

Inclusion 3: Lithic Calcixerolls, loamy-skeletal, mixed, frigid very gravelly loam--1 percent

Inclusion 4: Cobre sandy loam, 4 to 15 percent slopes--1 percent

Map Unit Setting

Landscape position: Mountains

Tecomar--Landform: Mountains; geomorphic position: backslope

Kram--Landform: Mountains; geomorphic position: backslope; shape of slope: convex

Amtoft--Landform: Mountains; geomorphic position: summit; shape of slope: convex

Inclusion 1--Landform: Mountains

Inclusion 2--Landform: Mountains; geomorphic position: backslope; aspect: south

Inclusion 3--Landform: Mountains; geomorphic position: backslope; position on slope: lower; shape of slope: convex

Inclusion 4--Landform: Mountains; geomorphic position: backslope; position on slope: lower; shape of slope: concave

Major Component Description

Tecomar Series

Elevation: 5,000 to 7,400 feet

Precipitation: About 12 inches

Air temperature: About 47 degrees

Frost-free season: About 100 days

Surface layer texture: Extremely stony silt loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Kram Series

Elevation: 5,000 to 7,400 feet

Precipitation: About 11 inches

Air temperature: About 46 degrees

Frost-free season: About 90 days

Surface rock fragments: 65 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Amtoft Series

Elevation: 5,000 to 7,400 feet

Precipitation: About 10 inches

Air temperature: About 47 degrees

Frost-free season: About 115 days

Surface rock fragments: 10 percent stones and boulders; 5 percent cobbles; 30 percent gravel

Surface layer texture: Extremely stony loam

Drainage class: Somewhat excessively drained

Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Dominant Present Vegetation

Tecomar: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Kram: Indian ricegrass, Utah juniper, black sagebrush

Amtoft: Thurber needlegrass, black sagebrush, bottlebrush squirreltail

Inclusion 1: None

Inclusion 2: Wyoming big sagebrush, bluebunch wheatgrass

Inclusion 3: Wyoming big sagebrush, bluebunch wheatgrass

Inclusion 4: Sandberg bluegrass, Wyoming big sagebrush

Ecological Site

Tecomar: 024XY031NV

Kram: 025XY060NV

 Inclusion 2--Landform: Drainageways

Major Component Description

Tecomar Series

Elevation: 5,200 to 5,600 feet
Precipitation: About 12 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface rock fragments: 10 percent cobbles; 45
 percent gravel
Surface layer texture: Extremely stony silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium
 derived from limestone and dolomite

Hopeka Series

Elevation: 5,200 to 5,600 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 85 days
Surface rock fragments: 10 percent cobbles; 50
 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium
 derived from limestone and dolomite

Rock outcrop Miscellaneous Area

Elevation: 5,200 to 5,600 feet

Dominant Present Vegetation

Tecomar: Thurber needlegrass, black sagebrush,
 bluebunch wheatgrass
 Hopeka: Utah juniper, black sagebrush, bluebunch
 wheatgrass, singleleaf pinyon
 Inclusion 1: Thurber needlegrass, black sagebrush
 Inclusion 2: Indian ricegrass, needleandthread,
 shadscale

Ecological Site

Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Tecomar Series

Elevation: 4,900 to 6,000 feet

Precipitation: About 12 inches

Air temperature: About 47 degrees

Frost-free season: About 100 days

Surface rock fragments: 10 percent cobbles; 30 percent gravel

Surface layer texture: Extremely stony silt loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Rock outcrop Miscellaneous Area

Elevation: 5,400 to 6,000 feet

Dominant Present Vegetation

Amtoft: Black sagebrush, bluebunch wheatgrass, bottlebrush squirreltail

Tecomar: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Inclusion 1: Utah juniper, black sagebrush

Inclusion 2: Indian ricegrass, Thurber needlegrass, black sagebrush

Inclusion 3: Wyoming big sagebrush, bluebunch wheatgrass

Inclusion 4: Wyoming big sagebrush, bluebunch wheatgrass

Ecological Site

Amtoft: 025XY057NV

Tecomar: 024XY031NV

Rock outcrop: None

Inclusion 1: 025XY060NV

Inclusion 2: 024XY030NV

Inclusion 3: 025XY015NV

Inclusion 4: 025XY021NV

3023--Amtoft-Jericho-Tecomar association

Composition

Major Components

Amtoft extremely gravelly loam, 15 to 50 percent slopes--35 percent

Jericho gravelly sandy loam, 4 to 15 percent slopes--30 percent

Tecomar extremely stony silt loam, 15 to 50 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Kram very gravelly loam, 15 to 50 percent slopes--5 percent

Inclusion 2: Peeko silt loam, 4 to 15 percent slopes--5 percent

Inclusion 3: Lithic Xerollic Calciorthids, loamy-skeletal, carbonatic, mesic very gravelly loam--5 percent

Map Unit Setting

Landscape position: Hills and intermontane basins

Amtoft--Landform: Hills; geomorphic position: backslope; aspect: south

Jericho--Landform: Fan remnants; geomorphic position: summit

Tecomar--Landform: Hills; geomorphic position: backslope; aspect: north

Inclusion 2--Landform: Fan remnants; geomorphic position: summit

Inclusion 3--Landform: Hills; geomorphic position: backslope; shape of slope: convex; aspect: south

Major Component Description

Amtoft Series

Elevation: 5,200 to 6,100 feet

Precipitation: About 10 inches

Air temperature: About 47 degrees

Frost-free season: About 115 days

Surface rock fragments: 15 percent cobbles; 70 percent gravel

Surface layer texture: Extremely gravelly loam

Drainage class: Somewhat excessively drained

Dominant parent material: Residuum and colluvium

derived from limestone and dolomite

Jericho Series

Elevation: 5,200 to 6,100 feet
Precipitation: About 10 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface rock fragments: 15 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Tecomar Series

Elevation: 5,200 to 6,100 feet
Precipitation: About 12 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface rock fragments: 10 percent cobbles; 30 percent gravel
Surface layer texture: Extremely stony silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Dominant Present Vegetation

Amtoft: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Jericho: Indian ricegrass, Wyoming big sagebrush, bottlebrush squirreltail

Major Component Description

Amtoft Series

Elevation: 6,400 to 7,000 feet
Precipitation: About 10 inches
Air temperature: About 47 degrees
Frost-free season: About 115 days
Surface rock fragments: 15 percent cobbles; 70 percent gravel
Surface layer texture: Extremely gravelly loam
Drainage class: Somewhat excessively drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Arcia Series

Elevation: 6,400 to 7,000 feet
Precipitation: About 14 inches
Air temperature: About 43 degrees
Frost-free season: About 75 days

Surface rock fragments: 5 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from sedimentary rocks

Kram Series

Elevation: 6,400 to 7,000 feet
Precipitation: About 11 inches
Air temperature: About 46 degrees
Frost-free season: About 90 days
Surface rock fragments: 65 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from limestone and dolomite

Dominant Present Vegetation

Amtoft: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Arcia: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush
 Kram: Utah juniper, black sagebrush, bluebunch wheatgrass
 Inclusion 1: Idaho fescue
 Inclusion 2: Idaho fescue
 Inclusion 3: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Inclusion 4: Idaho fescue, slender wheatgrass, snowberry

Ecological Site

 Inclusion 2--Landform: Hills; geomorphic position: summit
 Inclusion 3--Landform: Drainageways

Major Component Description

Cobre Series

Elevation: 5,400 to 6,300 feet
Precipitation: About 9 inches
Air temperature: About 45 degrees
Frost-free season: About 110 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from pyroclastic and extrusive volcanic rocks

Izar Series

Elevation: 5,400 to 6,300 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 110 days
Surface rock fragments: 60 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Somewhat excessively drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Jackpot Series

Elevation: 5,400 to 6,300 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 110 days
Surface layer texture: Sandy loam
Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dominant Present Vegetation

Cobre: Sandberg bluegrass, Wyoming big sagebrush, bottlebrush squirreltail

Izar: Indian ricegrass, black sagebrush

Jackpot: Indian ricegrass, big sagebrush, needleandthread

Inclusion 1: Wyoming big sagebrush, black sagebrush

Inclusion 2: Utah juniper, black sagebrush

Inclusion 3: Indian ricegrass, Wyoming big sagebrush, needleandthread

Inclusion 3--Landform: Fan remnants; geomorphic position: summit

Major Component Description**Fenelon Series***Elevation:* 6,200 to 6,700 feet*Precipitation:* About 12 inches*Air temperature:* About 43 degrees*Frost-free season:* About 85 days*Surface rock fragments:* 20 percent gravel*Surface layer texture:* Gravelly silt loam*Drainage class:* Well drained*Dominant parent material:* Residuum and colluvium derived from sedimentary rocks, loess and volcanic ash**Lerrow Variant Series***Elevation:* 6,200 to 6,700 feet*Precipitation:* About 12 inches*Air temperature:* About 43 degrees*Frost-free season:* About 95 days*Surface rock fragments:* 10 percent gravel*Surface layer texture:* Gravelly loam*Drainage class:* Well drained*Dominant parent material:* Alluvium derived from mixed rocks**Cotant Series***Elevation:* 6,200 to 6,700 feet

Precipitation: About 14 inches
Air temperature: About 42 degrees
Frost-free season: About 85 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Gravelly clay loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Dominant Present Vegetation

Fenelon: Black sagebrush, bluebunch wheatgrass
 Lerrow Variant: Idaho fescue, bluebunch wheatgrass, serviceberry
 Cotant: Idaho fescue, Sandberg bluegrass, low sagebrush
 Inclusion 1: Nevada bluegrass, alpine timothy, willow
 Inclusion 2: Thurber needlegrass, black sagebrush, bluebunch wheatgrass
 Inclusion 3: Idaho fescue, bluebunch wheatgrass, low sagebrush

Ecological Site

Fenelon: 024XY031NV
 Lerrow Variant: 025XY046NV
 Cotant: 025XY017NV
 Inclusion 1: 025XY006NV
 Inclusion 2: 025XY057NV
 Inclusion 3: 025XY017NV

3081--Fenelon-Gochea association

Composition

Major Components

Fenelon gravelly silt loam, 8 to 30 percent slopes--55 percent
 Gochea loam, 4 to 15 percent slopes--30 percent

Contrasting Inclusions

Inclusion 1: Donna very gravelly loam, 2 to 8 percent slopes--10 percent
 Inclusion 2: Coser gravelly clay loam, 4 to 15 percent slopes--2 percent
 Inclusion 3: Crooked Creek silty clay loam, drained, 0 to 2 percent slopes, rarely flooded--2 percent
 Inclusion 4: Shalclev very gravelly sandy loam, 4 to 15 percent slopes--1 percent

Map Unit Setting

Landscape position: Hills and intermontane basins
 Fenelon--Landform: Hills; geomorphic position: summit; shape of slope: convex
 Gochea--Landform: Fan remnants; geomorphic position: summit; position on slope: lower; shape

of slope: plane

 Inclusion 3--Landform: Drainageways
 Inclusion 4--Landform: Pediments; geomorphic position: summit; shape of slope: convex

Major Component Description

Fenelon Series

Elevation: 6,100 to 6,600 feet
Precipitation: About 12 inches
Air temperature: About 43 degrees
Frost-free season: About 85 days
Surface rock fragments: 20 percent gravel
Surface layer texture: Gravelly silt loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from sedimentary rocks, loess and volcanic ash

Gochea Series

Elevation: 6,100 to 6,600 feet
Precipitation: About 12 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Fenelon: Black sagebrush, bluebunch wheatgrass
 Gochea: Sandberg bluegrass, Wyoming big sagebrush, bluebunch wheatgrass
 Inclusion 1: Thurber needlegrass, bluebunch wheatgrass, low sagebrush
 Inclusion 2: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Inclusion 3: Nevada bluegrass, basin wildrye
 Inclusion 4: Thurber needlegrass, black sagebrush, bluebunch wheatgrass

Ecological Site

Prime Farmland

Prime Farmland and Other Important Farmland

In this section, prime farmland and other important farmland are defined. The map units in the survey area that are considered prime farmland are listed under "Prime Farmland Map Units" at the end of this section.

Prime Farmland

Prime farmland is of major importance in meeting the Nation's short- and long-range needs for food and fiber. The acreage of high-quality farmland is limited, and the U.S. Department of Agriculture recognizes that government at local, State, and Federal levels, as well as individuals, must encourage and facilitate the wise use of our Nation's prime farmland.

Prime farmland soils, as defined by the U.S. Department of Agriculture, are soils that are best suited to food, seed, forage, fiber, and oilseed crops. Such soils have properties that favor the economic production of sustained high yields of crops. The soils need only to be treated and managed by acceptable farming methods. An adequate moisture supply and a sufficiently long growing season are required. Prime farmland soils produce the highest yields with minimal expenditure of energy and economic resources, and farming these soils results in the least damage to the environment.

Prime farmland soils may presently be used as cropland, pasture, woodland or for other purposes. They are used for food and fiber or are available for these uses. Urban or built-up land and water areas cannot be considered prime farmland. Urban or built-up land is any contiguous unit of 10 acres or more in size that is used for such purposes as housing, industrial, and commercial sites, sites for institutions or public buildings, small parks, golf courses,

cemeteries, railroad yards, airports, sanitary landfills, sewage treatment plants, and water-control structures.

Prime farmland soils commonly receive an adequate and dependable supply of moisture from precipitation or irrigation. The temperature and growing season are favorable, and the level of acidity or alkalinity and the content of salts and sodium are acceptable. The soils have few, if any, rocks and are permeable to water and air. They are not excessively erodible or saturated with water for long periods, and they are not frequently flooded during the growing season or are protected from flooding. Slopes range mainly from 0 to 6 percent.

Soils that have a high water table, are subject to flooding, or are droughty may qualify as prime farmland where these limitations are overcome by drainage measures, flood control, or irrigation. Onsite evaluation is necessary to determine the effectiveness of corrective measures. More information about the criteria for prime farmland can be obtained at the local office of the Natural Resources Conservation Service.

A recent trend in land use has been the conversion of prime farmland to urban and industrial uses. The loss of prime farmland to other uses puts pressure on lands that are less productive than prime farmland.

About 19,530 acres, or nearly 0.9 percent of the survey area, would meet the requirements for prime farmland if an adequate and dependable supply of irrigation water were available.

The map units in the survey area that meet the requirements for prime farmland are listed under "Prime Farmland Map Units." On some soils included in the list, measures that overcome limitations are needed. The location of each map unit is shown on the detailed soil maps at the back of this publication. This list does not constitute a recommendation for a particular land use.

Unique Farmland

Unique farmland is land other than prime farmland that is used for the production of specific high-value food and fiber crops. It has the special combination of soil qualities, location, growing season, and moisture supply needed for the economic production of sustained high yields of a specific high-quality crop when treated and managed by acceptable farming methods. Examples of such crops are citrus, tree nuts, olives, cranberries, and vegetables.

Unique farmland is used for a specific high-value food or fiber crop; has an adequate supply of available moisture for the specific crop because of stored moisture, precipitation, or irrigation; and has a combination of soil qualities, growing season, temperature, humidity, air drainage, elevation, aspect, and other factors, such as nearness to markets, that favor the production of a specific food or fiber crop.

Lists of unique farmland are developed as needed in cooperation with conservation districts and other entities. There are presently no soils recognized as unique farmland in Nevada.

Additional Farmland of Statewide Importance

Some areas other than areas of prime and unique farmland are of statewide importance in the production of food, feed, fiber, forage, and oilseed crops. The criteria used in defining and delineating these areas are determined by the appropriate

State agency or agencies. Generally, additional farmland of statewide importance includes areas that nearly meet the criteria for prime farmland and that economically produce high yields of crops when treated and managed by acceptable farming methods. Some areas can produce as high a yield as areas of prime farmland if conditions are favorable. In some states additional farmland of statewide importance may include tracts of land that have been designated for agriculture by State law.

Nevada has designated any farmland that is irrigated to be of statewide importance.

Prime Farmland Map Units

The following map units are prime farmland where irrigated with an adequate and dependable water supply:

- 34 Welch-Crooked Creek association, dry
- 480 Devilsgait-Kelk association
- 521 Halleck, gravelly substratum-Halleck association

The following map units are prime farmland where they are irrigated with an adequate and dependable supply of water, and they are reclaimed:

- 580 Kelk-Sonoma association
- 590 Valmy-Enko association

Classification of the Soils

The system of soil classification used by the National Cooperative Soil Survey has six categories. Beginning with the broadest, these categories are the order, suborder, great group, subgroup, family, and series. Classification is based on soil properties observed in the field or inferred from those observations or from laboratory measurements. Table 14, "Classification of the Soils," in Part II of this Publication shows the classification of the soils in the survey area. The categories are defined in the following paragraphs.

ORDER. Eleven soil orders are recognized. The differences among orders reflect the dominant soil-forming processes and the degree of soil formation. Each order is identified by a word ending in *sol*. An example is Mollisol.

SUBORDER. Each order is divided into suborders primarily on the basis of properties that influence soil genesis and are important to plant growth or properties that reflect the most important variables within the orders. The last syllable in the name of a suborder indicates the order. An example is Xeroll (*Xer, meaning xeric, plus oll, from Mollisol*).

GREAT GROUP. Each suborder is divided into great groups on the basis of close similarities in kind, arrangement, and degree of development of pedogenic horizons; soil moisture and temperature regimes; and base status. Each great group is identified by the name of a suborder and by a prefix that indicates a property of the soil. An example is Argixeroll. (*Argi, meaning presence of argillic horizon, plus xeroll, the suborder of the Mollisols that have a xeric moisture regime*).

SUBGROUP. Each great group has a typic subgroup. Other subgroups are intergrades or extragrades. The typic is the central concept of the great group; it is not necessarily the most extensive. Intergrades are transitions to other orders, suborders, or great groups. Extragrades have some properties that are not representative of the great group but do not indicate transitions to any other known kind of soil. Each subgroup is identified by one or more adjectives preceding the name of the great group. The adjective *Typic*

identifies the subgroup that typifies the great group. An example is Typic Argixerolls.

FAMILY. Families are established within a subgroup on the basis of physical and chemical properties and other characteristics that affect management. Generally, the properties are those of horizons below plow depth where there is much biological activity. Among the properties and characteristics considered are particle-size class, mineral content, temperature regime, thickness of the root zone, consistence, moisture equivalent, slope, and permanent cracks. A family name consists of the name of a subgroup preceded by terms that indicate soil properties. An example is loamy-skeletal, mixed, frigid, Typic Argixerolls.

SERIES. The series consists of soils that have similar horizons in their profile. The horizons are similar in color, texture, structure, reaction, consistence, mineral and chemical composition, and arrangement in the profile. The texture of the surface layer or of the substratum can differ within a series.

Taxonomic Units and Their Morphology

In this section, each taxonomic unit recognized in the survey area is described. The descriptions are arranged in alphabetic order.

Characteristics of the soil and the material in which it formed are identified for each unit. A pedon, a small three-dimensional area of soil, that is typical of the unit in the survey area is described. The detailed description of each soil horizon follow standards in the "Soil Survey Manual"(18). Many of the technical terms used in the descriptions are defined in "Soil Taxonomy"(20). Unless otherwise stated, colors in the descriptions are for dry soil. Following the pedon description is the range of important characteristics of the soils in the unit.

The map units of each taxonomic unit are

described in the section "Detailed Soil Map Units".

Ackett Series

The Ackett series consists of well drained soils that are shallow to a duripan, formed in alluvium and colluvium from welded tuff, loess, and volcanic ash. Ackett soils are on fan remnants and hills. Slopes are 2 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, mesic, shallow Xerollic Durargids

Typical pedon: Ackett very gravelly loam, 2 to 8 percent slopes, is located in an area of map unit 674. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 60 percent pebbles and 5 percent cobbles.

A--0 to 2 inches; grayish brown (10YR 5/2) very gravelly loam, dark grayish brown (10YR 4/2) moist; moderate thick platy structure; slightly hard, very friable, moderately sticky and slightly plastic; few very fine and fine roots; many very fine and fine vesicular pores; 50 percent pebbles of which 5 percent are duripan fragments; slightly alkaline (pH 7.8); clear smooth boundary.

Bt--2 to 5 inches; brown (10YR 5/3) clay loam, dark brown (10YR 4/3) moist; weak coarse subangular blocky structure; slightly hard, firm, sticky and plastic; common very fine and fine, and few medium and coarse roots; common very fine tubular pores; few thin clay films lining pores; 5 percent pebble size duripan fragments; slightly alkaline (pH 7.8); clear smooth boundary.

2Btkq--5 to 8 inches; brown (10YR 5/3) extremely cobbly clay, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; hard, firm, very sticky and very plastic; common very fine through medium roots; common very fine tubular pores; few thin clay films lining pores; 20 percent pebbles and 40 percent cobbles, of which 90 percent are duripan fragments; moderately alkaline (pH 8.2); clear smooth boundary.

2Btk--8 to 13 inches; light gray (10YR 7/2) extremely cobbly clay loam, dark yellowish

brown (10YR 4/4) moist; moderate medium subangular blocky structure; hard, firm, moderately sticky and moderately plastic; few very fine and fine roots; common very fine tubular pores; common thin clay films lining pores; 40 percent pebbles and 35 percent cobbles, of which 90 percent are duripan fragments; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

2Bqkm1--13 to 25 inches; white (10YR 8/1) indurated duripan with a 1 to 4 mm thick fractured discontinuous silica laminar cap, fractures greater than 4 inches apart; few very fine and fine roots in fractures; violently effervescent; clear wavy boundary.

2Bqkm2--25 to 51 inches; white (10YR 8/1) indurated duripan with a 1 to 3 mm thick continuous silica laminar cap; violently effervescent; abrupt wavy boundary.

3Bkq--51 to 61 inches; light gray (10YR 7/2) coarse sandy loam, brown (10YR 5/3) moist; massive; hard, firm and brittle, slightly sticky and slightly plastic; common very fine tubular pores; 50 percent discontinuous strongly silica cemented; 10 percent pebbles of which 5 percent are duripan fragments; continuous brittle matrix; violently effervescent; strongly alkaline (pH 8.8); abrupt wavy boundary.

R--61 inches; tuffaceous rock.

Type location: Elko County, Nevada; approximately 3 1/2 miles west of Jackpot; about 2,000 feet west and 1,000 feet south of the northeast corner of section 9, T. 47 N., R. 64 E.; (41 degrees, 58 minutes, 45 seconds north latitude, 114 degrees, 43 minutes, 15 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry June through October.

Soil temperature: 47 to 50 degrees F.

Depth to duripan: 10 to 20 inches

Depth to carbonates: 5 to 14 inches

Depth to bedrock: More than 60 inches

Fragments above duripan: Dominantly fractured indurated pan fragments

A horizon:

Value--5 or 6 dry, 4 or 5 moist

Chroma--2 or 3.

Bt horizon:

Value--5 or 6 dry, 4 or 5 moist
 Chroma--3 or 4.
 Texture--Clay loam, clay or gravelly clay loam.
 Clay content--35 to 50 percent
 Rock fragments--5 to 30 percent, mostly pebbles.

2Btkq and 2Btk horizons:

Value--5 to 7 dry, 4 to 7 moist
 Chroma--2 to 4 dry or moist
 Texture--Very cobbly clay, extremely cobbly clay, very cobbly clay loam, extremely cobbly clay loam, extremely gravelly clay, extremely gravelly clay loam, very gravelly clay loam
 Clay content--35 to 55 percent
 Rock fragments--40 to 80 percent.
 Carbonates--20 to 30 percent calcium carbonate equivalent
 Structure--Massive or subangular blocky.

2Bqkm horizon:

Value--7 or 8 dry
 Chroma--1 through 3 dry or moist
 Distance between fractures--4 to 30 inches
 Width of fractures--1/4 inch or less

3Bkq horizon:

Texture--Extremely gravelly sand, coarse sandy loam, gravelly coarse sandy loam, and gravelly sandy loam.
 Reaction--Moderately alkaline or strongly alkaline.

Affey Series

The Affey series consists of very deep, moderately well drained soils that formed in alluvium derived from mixed rocks and volcanic ash. The Affey soils are on summits and side slopes of fan remnants. Slopes are 4 to 15 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, frigid Durargidic Argixerolls

Typical pedon: Affey gravelly loam, 4 to 15 percent slopes, is located in an area of map unit 850. (Colors are for dry soil unless otherwise

noted.) The soil surface is partially covered with 35 percent pebbles.

A1--0 to 9 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and few medium roots; many very fine, few fine, and medium tubular pores; 20 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

A2--9 to 12 inches; grayish brown (10YR 5/2) gravelly clay loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; few very fine, fine and medium roots; many very fine, few fine and medium tubular pores; 20 percent pebbles; slightly alkaline (pH 7.6); abrupt wavy boundary.

Bt1--12 to 21 inches; brown (10YR 5/3) gravelly clay loam, dark brown (10YR 4/3) moist; moderate medium prismatic structure parting to moderate medium angular blocky; hard, firm, moderately sticky and very plastic; few very fine, fine and medium roots; many very fine, common fine and few medium tubular pores; many slickensides on faces of peds; many very fine manganese concretions; 25 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

Bt2--21 to 24 inches; yellowish brown (10YR 5/4) very gravelly clay, dark yellowish brown (10YR 4/4) moist; moderate medium angular blocky structure; hard, firm, very sticky and very plastic; few very fine, fine and medium roots; many very fine, common fine and few medium tubular pores; many slickensides on faces of ped; many very fine manganese concretions; 55 percent pebbles; slightly alkaline (pH 7.4); abrupt wavy boundary.

Btk1--24 to 31 inches; yellowish brown (10YR 5/4) very gravelly clay, dark yellowish brown (10YR 4/4) moist; moderate medium prismatic structure; hard, firm, very sticky and very plastic; few very fine, fine, medium and coarse roots; many very fine, common fine, and few medium tubular pores; many slickensides on faces of peds; many very fine manganese concretions; common, fine, segregated lime in seams; 40 percent pebbles; noneffervescent matrix; slightly alkaline (pH 7.6); abrupt wavy boundary.

Btk2--31 to 34 inches; yellowish brown (10YR 5/4) very gravelly clay, dark yellowish brown (10YR 4/4) moist; moderate medium prismatic structure; hard, firm, very sticky and very plastic; few very fine, fine, medium and coarse roots; many very fine, common fine and few medium tubular pores; many slickensides on faces of peds; many very fine manganese concretions; 35 percent pebbles and 5 percent cobbles; violently effervescent; moderately alkaline (pH 8.0); clear wavy boundary.

Bqk--34 to 60 inches; very pale brown (10YR 7/3) extremely gravelly clay loam, brown (10YR 4/3) moist; massive; hard, firm and brittle, slightly sticky and slightly plastic; many very fine and fine tubular pores; up to 50 percent horizontal discontinuous strongly silica cemented lenses; common fine segregated lime in seams, filaments, and few fine soft masses; common thin to moderately thick silica pendants on undersides of pebbles; 65 percent pebbles, 5 percent cobbles; continuous brittle matrix; violently effervescent; moderately alkaline (pH 8.4).

Type location: Elko County, Nevada; approximately 30 miles north of Pequop; about one mile and 2,970 feet north and 875 feet east of the northwest corner of section 1 T. 42 N., R. 65 E.; (41 degrees, 34 minutes, 52 seconds north latitude, 114 degrees, 33 minutes, 48 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in the winter and spring, dry from early July through October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 10 to 16 inches, may include the upper part of argillic horizon.

Depth to pedogenic lime: 18 to 39 inches.

Depth to the Bq horizon: 26 to 39 inches.

Control section:

Clay content--35 to 50 percent.

Rock fragments--Averages 35 to 50, mainly pebbles with up to 10 percent cobbles and stones.

A horizon:

Value--4 or 5 dry, 3 or 4 moist.

Chroma--2 or 3.

Reaction--Neutral or slightly alkaline.

Bt horizons:

Hue--7.5YR or 10YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--3 or 4.

Texture--Gravelly clay loam in the upper subhorizon and very gravelly clay loam or very gravelly clay in the lower subhorizons.

Clay content--35 to 50 percent.

Structure--Prismatic or angular blocky.

Reaction--Neutral or slightly alkaline.

Btk horizons:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 through 5 moist.

Clay content--40 to 50 percent.

Structure--Prismatic or angular blocky.

Reaction--Slightly alkaline or moderately alkaline.

Bqk horizons:

Hue--10YR or 7.5YR.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--3 or 4.

Consistence--Hard or very hard and brittle.

Reaction--Moderately alkaline or strongly alkaline.

Cementation--Continuous brittle matrix, with up to 50 percent thin to thick bands or lenses of discontinuous strong silica cemented material.

Agassiz Series

The Agassiz series consists of shallow, somewhat excessively drained soils that formed in residuum derived from limestone and dolomite. Agassiz soils are on side slopes of mountains. Slopes are 4 to 70 percent. The mean annual precipitation is about 16 inches, and the mean annual temperature is about 42 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Lithic Haploxerolls

Typical pedon: Agassiz very gravelly loam, 30 to 75 percent slopes, is located in an area of map unit 1010. (Colors are for dry soil unless otherwise noted.) The soil surface is covered with 55 percent pebbles and 10 percent cobbles.

A1--0 to 2 inches; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; weak, fine granular structure; soft, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine and common fine tubular pores; 40 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.4); clear wavy boundary.

A2--2 to 6 inches; brown (10YR 5/3) extremely cobbly loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, and few fine and medium roots; common very fine tubular pores; 40 percent pebbles, 15 percent cobbles and 5 percent stones; slightly alkaline (pH 7.4); clear wavy boundary.

A3--6 to 11 inches; brown (10YR 5/3) extremely cobbly loam, very dark grayish brown ((10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, few fine, and medium roots; common very fine tubular pores; 30 percent pebbles, 30 percent cobbles and 10 percent stones; slightly alkaline (pH 7.6); abrupt irregular boundary.

R--11 inches; hard, fractured limestone.

Type location: Elko County, Nevada; approximately 23 miles north of Wells in the Snake Mountains; about 2,200 feet west and 1,800 feet south of the northeast corner of section 13, T. 41 N., R. 61 E.; (41 degrees, 26 minutes, 43 seconds north latitude and 115 degrees, 01 minute, 06 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; dry from about mid July through September.

Soil temperature: 42 to 46 degrees F.

Mollic epipedon thickness: 10 to 17 inches.

Depth to bedrock: 10 to 20 inches.

Other features: A thin C horizon occurs below the A horizon in some pedons.

Control section:

Clay content--20 to 27 percent.

Reaction--Neutral to slightly alkaline.

Texture--Dominantly very cobbly loam, extremely cobbly loam.

Rock fragments--50 to 80 percent, mainly pebbles, cobbles, and some stones.

A horizon:

Hue--10YR or 7.5YR

Value--3 through 5 dry, 2 or 3 moist

Chroma--2 or 3.

Agort Series

The Agort series consists of very shallow and shallow, somewhat excessively drained soils that formed in residuum and colluvium from granitic rocks. The Agort soils are on mountains. Slopes are 15 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 41 degrees F.

Taxonomic class: Loamy, mixed, frigid, shallow Entic Haploxerolls

Typical pedon: Agort gravelly sandy loam, 15 to 30 percent slopes, is located in an area of map unit 310. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 35 percent pebbles and 5 percent with cobbles.

A--0 to 5 inches; dark grayish brown (10YR 4/2) gravelly sandy loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine tubular pores; 25 percent pebbles; neutral (pH 7.0). gradual smooth boundary.

Cr--5 to 20 inches; weathered granite.

Type location: Elko County, Nevada; approximately 16 miles south of Jackpot in the Granite Range; about 1,000 feet north and 1,500 feet west of the southeast corner of section 30, T. 45 N., R. 65, E.; (41 degrees, 45 minutes, 15 seconds north latitude and 114 degrees, 39 minutes, 10 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry from late June through October.

Soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 4 to 14 inches.

Depth to paralithic contact: 4 to 14 inches.

Control section:

Clay content--6 to 15 percent.

Rock fragments--15 to 35 percent, mainly pebbles.

A horizon:

Value--4 or 5 dry.

Chroma--2 or 3.

Akler Series

The Akler series consists of shallow, well drained soils that formed in residuum from tuff, welded tuff, conglomerate and other volcanic or sedimentary rocks. Akler soils are on hills. Slopes are 4 to 30 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 42 degrees F.

Taxonomic class: Clayey, montmorillonitic, frigid, shallow Xerollic Haplargids

Typical pedon: Akler loam, 8 to 15 percent slopes, is located in an area of map unit O10. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 20 percent pebbles.

A1--0 to 2 inches; light brownish gray (10YR 6/2) loam, dark grayish brown (10YR 4/2) moist; moderate thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine and fine vesicular pores; 10 percent pebbles; slightly alkaline (pH 7.5); clear wavy boundary.

A2--2 to 6 inches; pale brown (10YR 6/3) clay loam, very dark grayish brown (10YR 3/2) moist; weak very thin platy structure; slightly hard, very friable, moderately sticky and moderately plastic; many very fine, few fine and medium roots; common very fine interstitial pores; few thin clay films on faces of peds along the lower boundary; 5 percent pebbles; neutral (pH 7.3); abrupt smooth boundary.

Bt--6 to 18 inches; light brownish gray (2.5Y 6/2) clay, dark grayish brown (2.5Y 4/2) moist; strong medium prismatic structure; very hard, very firm, very sticky and very plastic; common fine and very fine roots; common very fine interstitial pores; continuous stress surface; slightly alkaline (pH 7.4); clear wavy boundary.

Cr--18 to 36 inches; dark grayish brown (2.5Y 4/2) soft, weathered saprolitic tuff; few very fine roots; slightly alkaline (pH 7.4).

Type location: Elko County, Nevada; approximately 20 miles northwest of Wells; about 900 feet west and 1,600 feet north of the southeast corner of section 32 T. 41 N., R. 61 E.; (41 degrees, 23 minutes, 49 seconds north latitude and 115 degrees, 05 minutes, 34 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the winter and spring dry mid June through October.

Soil temperature: 44 to 47 degrees F.

Depth to paralithic contact: 14 to 20 inches.

Control section:

Clay content--50 to 60 percent.

Reaction--Neutral or slightly alkaline.

Rock fragments--0 to 15 percent, mainly pebbles with some pedons having 15 to 35 percent pebbles and some pedons near rock outcrops having cobbles in their profile.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Bt horizon:

Hue--2.5Y or 10YR.

Value--5 or 6 dry, 3 through 5 moist.

Chroma--2 through 4.

Cr horizon:

Clay films--Common in upper horizon along fracture planes.

Amene Series

The Amene series consists of shallow, well drained soils that formed in residuum derived from limestone and dolomite. The Amene soils are on mountains. Slopes are 15 to 75 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy-skeletal, carbonatic, frigid Lithic Calcixerolls

Typical pedon: Amene very gravelly silt loam, 15 to 50 percent slopes, is located in an area of map unit 560. (Colors are for dry soil unless otherwise noted.)

- A1--0 to 2 inches; grayish brown (10YR 5/2) very gravelly silt loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, sticky and moderately plastic; common very fine roots; many very fine interstitial and vesicular pores; 40 percent pebbles; violently effervescent; slightly alkaline (pH 7.8); clear wavy boundary.
- A2--2 to 8 inches; brown (10YR 5/3) very gravelly silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, very friable, moderately sticky and moderately plastic; common very fine roots; common very fine tubular pores; 45 percent pebbles; violently effervescent; slightly alkaline (pH 7.8); clear wavy boundary.
- Bk1--8 to 11 inches; brown (10YR 5/3) very gravelly silt loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, sticky and plastic; many very fine and few fine roots; common very fine and fine tubular pores; thin lime coats on undersides of rock fragments; 45 percent pebbles and 10 percent cobbles; violently effervescent; moderately alkaline (pH 8.2); clear irregular boundary.
- Bk2--11 to 16 inches; very pale brown (10YR 7/3) very gravelly silt loam, brown (10YR 5/3) moist; weak medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; many very fine, few fine, and coarse roots; common very fine and fine tubular pores; continuous thick lime pendants covering rock fragments; 40 percent pebbles, 15 percent cobbles; violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.
- R--6 inches; hard fractured limestone.

Type location: Elko County, Nevada; approximately 24 miles north of Wells in the Snake Mountains; about 150 feet east and 2,000 feet south of the northwest corner of section 14, T. 41 N., R. 61 E.; (41 degrees, 26 minutes, 39 seconds north latitude and 115 degrees, 03 minutes, 00 seconds west longitude.)

Range in Characteristics:

- Soil moisture:* Usually dry for 80 to 100 consecutive days, moist in the winter through early summer, dry late July through October.
- Soil temperature:* 44 to 47 degrees F.
- Mollic epipedon thickness:* 7 to 13 inches.
- Depth to bedrock:* 14 to 20 inches.

Depth to calcic horizon: 7 to 13 inches.

Control section:

- Clay content--20 to 27 percent.
- Reaction--Slightly alkaline or moderately alkaline.
- Rock fragments--40 to 60 percent, mainly pebbles with up to 15 percent cobbles.

A horizon:

- Value--4 or 5 dry, 2 or 3 moist.
- Chroma--2 or 3.

Bk horizons:

- Value--5 through 7 dry, 3 through 5 moist.
- Chroma--3 or 4 dry and moist.
- Texture--Very gravelly silt loam, very gravelly loam.
- Calcium carbonate equivalent--40 to 60 percent (less than 20 millimeters fraction).
- Other features--Thin to thick lime coats and pendants are common on underside of rock fragments or coat all surfaces of rock fragments.

Amtoft Series

The Amtoft series consists of shallow, somewhat excessively drained soils that formed in residuum and colluvium derived from limestone and other strongly calcareous sedimentary rocks. Amtoft soils are on hills and mountains. Slopes are 4 to 50 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy-skeletal, carbonatic, mesic Lithic Xerollic Calciorthids

Typical pedon: Amtoft extremely gravelly loam, 15 to 50 percent slopes, is located in an area of map unit 3023. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 70 percent pebbles and 10 percent cobbles.

A1--0 to 1 inch; light gray (10YR 7/2) extremely gravelly loam, dark grayish brown (10YR 4/2) moist; moderate medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; many very fine and fine vesicular pores; 65 percent pebbles and 10 percent

cobbles; violently effervescent; strongly alkaline (pH 8.6); abrupt smooth boundary.

A2--1 to 3 inches; light gray (10YR 7/2) extremely gravelly loam, brown (10YR 5/3) moist; moderate very fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine and medium roots; common very fine tubular pores; few thin and moderately thick lime pendants on undersides of rock fragments; 65 percent pebbles and 10 percent cobbles; violently effervescent; strongly alkaline (pH 8.6); abrupt wavy boundary.

Bk1--3 to 7 inches; light yellowish brown (10YR 6/4) extremely cobbly loam, yellowish brown (10YR 5/4) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and medium roots; common very fine and fine tubular pores; many thick and very thick lime pendants on undersides of rock fragments; 35 percent pebbles, 30 percent cobbles and 5 percent stones; violently effervescent; strongly alkaline (pH 8.6); clear wavy boundary.

Bk2--7 to 12 inches; light yellowish brown (10YR 6/4) extremely cobbly loam, yellowish brown (10YR 5/4) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and medium roots; common very fine and fine tubular pores; many thick and very thick lime pendants on undersides of rock fragments; 35 percent pebbles, 30 percent cobbles and 5 percent stones; violently effervescent; strongly alkaline (pH 8.6); abrupt wavy boundary.

R--12 inches; highly fractured limestone; common, medium lime masses in fractures.

Type location: Elko County; approximately 26 miles northwest of Montello in an unsectionized area; about 400 feet east and 500 feet north of the posted benchmark (elevation 5,335) and about 150 feet north of road; (41 degrees, 32 minutes, 38 seconds north latitude and 114 degrees, 21 minutes, 08 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in some part from October through May. Dry June through September.

Soil temperature: 47 to 52 degrees F.

Calcic horizon thickness: 6 to 10 inches.

Depth to bedrock: 10 to 20 inches.

Control section:

Clay content--12 to 25 percent.

Carbonates--Average 40 to 80 percent calcium carbonate equivalent.

Reaction--Moderately alkaline or strongly alkaline.

Rock fragments--60 to 80 percent

A horizon:

Hue--2.5Y or 10YR.

Value--6 or 7 dry, 3 through 5 moist.

Chroma--2 or 3.

Bk horizon:

Hue--2.5Y, 10YR or 7.5YR.

Value--6 through 8 dry, 4 through 7 moist.

Chroma--3 or 4.

Textures--Extremely gravelly loam, extremely cobbly loam, extremely flaggy loam.

Anowell Series

The Anowell series consists of very shallow, well drained soils that formed in residuum and colluvium from tuffaceous rocks. The Anowell soils are on pediments and hills. Slopes are 4 to 30 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Loamy, mixed, mesic, shallow Xerollic Haplargids

Typical pedon: Anowell gravelly loam, 8 to 30 percent slopes, is located in an area of map unit 3032. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 50 percent pebbles.

A--0 to 2 inches; light brownish gray (2.5Y 6/2) gravelly loam, dark grayish brown (2.5Y 4/2) moist; weak thin and medium platy structure; slightly hard, very friable, moderately sticky and moderately plastic; common very fine roots; many very fine interstitial and tubular pores; 25 percent pebbles; strongly effervescent; strongly alkaline (pH 8.6); abrupt wavy boundary.

Btk--2 to 6 inches; light yellowish brown (2.5Y 6/4) gravelly clay loam, olive brown (2.5Y 4/4) moist; weak coarse subangular blocky structure; 20 percent rock structure; slightly

hard, very friable, very sticky and very plastic; common very fine, fine, and medium roots; many very fine interstitial and few fine tubular pores; common moderately thick clay films lining pores and on faces of peds; thin lime coats on undersides of pebbles; 15 percent pebbles; strongly effervescent; strongly alkaline (pH 8.6); abrupt wavy boundary.

Cr--6 to 10 inches; soft, fractured, platy tuffaceous sediments; few very fine, fine, and medium roots along fractures; strongly effervescent.

Type location: Elko County, Nevada; approximately 5 miles northwest of Montello near Toano Draw, about 375 feet west and 1750 feet south of the northeast corner of section 6 T. 40 N., R. 67 E.; (41 degrees, 22 minutes, 41 seconds north latitude and 114 degrees, 26 minutes, 13 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the winter and spring, dry from mid-June through October.

Soil temperature: 47 to 52 degrees F.

Depth to paralithic contact: 5 to 12 inches.

Control section:

Clay content--20 to 35 percent.

Reaction--Moderately alkaline or strongly alkaline.

Rock fragments--10 to 30 percent, mainly pebbles.

A horizon:

Hue--10YR or 2.5YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Effervescence--Slightly effervescent or strongly effervescent.

Btk horizons:

Hue--10YR or 2.5YR.

Value--6 or 7 dry, 3 or 4 moist.

Chroma--3 or 4.

Texture--Clay loam, gravelly loam or gravelly clay loam.

Clay content--25 to 35 percent.

Rock fragments--10 to 30 percent, mainly pebbles.

Structure--Weak or moderate subangular blocky or angular blocky.

Carbonates--1 to 5 percent calcium carbonate equivalent (less than 20mm fraction).

Appian Series

The Appian series consists of very deep, well drained soils that formed in alluvium derived from mixed rocks and lake sediments. Appian soils are on lake plains. Slopes are 0 to 2 percent. The mean annual precipitation is about 7 inches and the mean annual temperature is about 50 degrees F.

Taxonomic class: Fine-loamy over sandy or sandy-skeletal, mixed, mesic Typic Natrargids

Typical pedon: Appian fine sandy loam, 0 to 2 percent slopes, is located in an area of map unit 2060. (Colors are for dry soil unless otherwise noted.)

A1--0 to 1 1/2 inches; light brownish gray (2.5Y 6/2) fine sandy loam, dark grayish brown (2.5Y 4/2) moist; moderate thick platy structure; hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; many very fine and fine vesicular pores; violently effervescent; very strongly alkaline (pH 9.6); abrupt wavy boundary.

A2--1 1/2 to 3 inches; light gray (2.5Y 7/2) loam, grayish brown (2.5Y 5/2) moist; moderate thick platy structure; hard, very friable, slightly sticky and slightly plastic; few very fine and fine roots; many very fine, fine and few medium vesicular pores; violently effervescent; very strongly alkaline (pH 9.6); abrupt wavy boundary.

Btk1--3 to 8 inches; pale brown (10YR 6/3) clay loam, brown (10YR 4/3) moist; light gray (2.5Y 7/2) uncoated sand grains on prism caps; moderate coarse prismatic structure parting to moderate medium platy; hard, very friable, moderately sticky and moderately plastic; common very fine, fine, few medium, and coarse roots matted on faces of peds; common very fine, fine vesicular, many very fine and fine tubular pores; common thin clay films on faces of peds and lining tubular pores; few fine filaments of lime; violently effervescent; very strongly alkaline (pH 9.6); abrupt wavy boundary.

Btk2--8 to 11 inches; light gray (2.5Y 7/2) sandy clay loam, grayish brown (2.5Y 5/2) moist; moderate coarse prismatic structure parting to strong medium platy; hard, very friable, moderately sticky and slightly plastic; many

very fine, fine, few medium, and coarse roots matted on faces of peds; common very fine tubular pores; common thin clay films on faces of peds and lining tubular pores; few fine filaments of lime; violently effervescent; very strongly alkaline (pH 9.6); abrupt wavy boundary.

2C--11 to 60 inches; light gray (2.5Y 7/2) stratified coarse sand to fine sand, grayish brown (2.5YR 5/2) moist; few prominent light yellowish brown (10YR 6/4) mottles; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; many very fine and fine interstitial pores; weak lime cementation; common krotovinas that are single grain; strongly effervescent; very strongly alkaline (pH 9.6).

Type location: Elko County, Nevada; approximately 10 miles northeast of Montello; about 1,200 feet south and 2,500 feet east of the northwest corner of section 30, T. 40 N., R. 70 E.; (41 degrees, 19 minutes, 32 seconds north latitude and 114 degrees, 05 minutes, 22 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist for short periods in winter and early spring, dry May through October.

Soil temperature: 53 to 57 degrees F.

Combined thickness of A and Btn horizons: 7 to 18 inches.

Depth to sandy 2C horizon: 7 to 18 inches.

A horizon:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--1 or 2.

Reaction--Moderately alkaline to very strongly alkaline.

Btnk horizon:

Hue--10YR or 2.5Y.

Value--4 through 7 dry, 4 or 5 moist.

Chroma--2 through 4.

Texture--Clay loam, or sandy clay loam.

Clay content--27 to 35 percent.

Exchangeable sodium--20 to 50 percent.

Structure--Moderate or strong, fine to coarse, columnar or prismatic.

Reaction--Strongly alkaline or very strongly alkaline.

Other features--Few or common, fine or medium white lime or gypsum segregations and filaments.

2C horizons:

Hue--2.5Y, 10YR.

Value--6 or 7 dry, 3 through 5 moist.

Chroma--2 or 3.

Texture--Predominantly sand; stratified with textures that include coarse sand, fine sand, loamy sand, loamy fine sand, fine sandy loam, or sandy loam.

Rock fragments--Up to 75 percent pebbles in some pedons.

Relict iron mottles--Few to many, fine to large, faint to prominent high chroma with hue of 10YR, 7.5YR, or 5YR.

Reaction--Slightly alkaline through very strongly alkaline.

Arcia Series

The Arcia series consists of moderately deep, well drained soils that formed in residuum and colluvium from mixed rocks. The Arcia soils are on hills and mountains. Slopes are 4 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid Pachic Argixerolls.

Typical pedon: Arcia silt loam, 15 to 30 percent slopes is located in an area of map unit 462. (Colors are for dry soil unless otherwise noted.)

A1--0 to 3 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate fine granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine and common fine tubular pores; 5 percent pebbles; neutral (pH 6.8); abrupt smooth boundary.

A2--3 to 9 inches; dark grayish brown (10YR 4/2) silt loam, very dark grayish brown (10YR 3/2) moist; strong medium subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine, fine, and few medium roots; many very fine and

few fine tubular pores; 5 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt1--9 to 17 inches; dark grayish brown (10YR 4/2) clay loam, very dark grayish brown (10YR 3/2) moist; strong fine and medium subangular blocky structure; hard, friable, very sticky and plastic; common very fine, fine, and medium roots; many very fine and few fine tubular pores; 10 percent pebbles; common thin clay films on faces of peds and lining pores; neutral (pH 6.8); abrupt wavy boundary.

2Bt2--17 to 27 inches; grayish brown (10YR 5/2) cobbly clay, dark brown (10YR 3/3) moist; moderate medium prismatic structure; very hard, very firm, very sticky and very plastic; few very fine roots; common very fine interstitial and few fine tubular pores; 5 percent pebbles and 10 percent cobbles; many moderately thick clay films on faces of peds and lining pores; neutral (pH 6.8); abrupt wavy boundary.

2Bt3--27 to 32 inches; brown (10YR 5/3) gravelly clay, dark grayish brown (10YR 4/2) moist; massive; very hard, very firm, very sticky and very plastic; few very fine roots; common very fine interstitial pores, 25 percent pebbles and 5 percent cobbles; many moderately thick clay films lining pores; 10 percent rock structure; neutral (pH 6.8). abrupt irregular boundary.

3R--32 inches; sandstone and conglomerate bedrock.

Type location: Elko County, Nevada; approximately 20 miles north of Wells; about 800 feet west and 3,000 feet south of the projected northeast corner of section 3, T. 40 N., R. 61 E.; (41 degrees, 23 minutes, 03 seconds north latitude and 115 degrees, 03 minutes, 44 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist winter and spring, dry mid July through early October.

Soil temperature: 42 to 47 degrees F.

Mollic epipedon thickness: 20 to 30 inches; includes the upper argillic horizon.

Depth to bedrock: 30 to 40 inches.

Control section:

Clay content--Averages 35 to 50 percent.

Rock fragments--Averages 5 to 20 percent, mainly pebbles with some cobbles.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--1 through 3.

Bt1 horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--1 through 3.

Texture--Clay loam or gravelly clay loam.

Clay content--30 to 40 percent.

Rock fragments--0 to 30 percent, mainly pebbles.

Lower 2Bt subhorizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 through 4 with lower chroma typically in the upper subhorizons.

Clay content--40 to 60 percent.

Rock fragments--Average 5 to 35 percent mainly pebbles and cobbles.

Texture--Clay, gravelly clay, cobbly clay. It is common to find a very cobbly clay with 35 to 50 percent rock fragments in some pedons immediately above the lithic contact.

Structure--Prismatic or massive

Arva Series

The Arva series consists of deep, well drained soils that formed in colluvium and alluvium from mixed rocks. The Arva soils are on hills, mountains, and fan remnants. Slopes are 8 to 30 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid Pachic Argixerolls

Typical pedon: Arva gravelly loam, 8 to 30 percent slopes, is located in an area of map unit O60. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine tubular pores; 30 percent pebbles; neutral (pH 6.8); clear smooth boundary.

A2--2 to 8 inches; dark grayish brown (10YR 4/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky

structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine and common fine tubular pores; 20 percent pebbles; neutral (pH 6.8); gradual wavy boundary.

AB--8 to 15 inches; grayish brown (10YR 5/2) gravelly clay loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; common very fine roots; many very fine and few fine tubular pores; few thin clay films lining pores; 20 percent pebbles; neutral (pH 6.8); gradual wavy boundary.

Bt1--15 to 29 inches; brown (10YR 5/3) gravelly clay, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; very hard, very firm, very sticky and very plastic; common very fine roots; many very fine and few fine tubular pores; many moderately thick clay films on faces of peds and lining pores; 30 percent pebbles; neutral (pH 6.7); gradual wavy boundary.

Bt2--29 to 44 inches; brown (7.5YR 5/2) gravelly clay, dark brown (7.5YR 4/2) moist; strong medium prismatic structure; extremely hard, very firm, very sticky and very plastic; few very fine roots; common very fine interstitial and tubular pores; many distinct stress surfaces; 15 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

Cr--44 inches; weathered conglomerate.

Type location: Elko County, Nevada; approximately 20 miles north of Wells; about 1,500 feet south and 500 feet east of the projected northwest corner of section 1 T. 40 N., R. 61 E.; (41 degrees, 23 minutes, 02 seconds north latitude and 115 degrees, 02 minutes, 17 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, dry mid-July through October.

Soil temperature: 42 to 47 degrees F.

Mollic epipedon thickness: 20 to 30 inches, and includes upper part of the Bt horizon.

Depth to paralithic contact: 40 to 60 inches.

Other features--There is a gradual or clear boundary between the A and Bt horizon.

Control section:

Clay content--45 to 60 percent.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Hue--7.5YR or 10YR.

Value--3 or 4 moist.

Chroma--2 or 3.

Texture--Clay or gravelly clay.

Rock fragments--10 to 35 percent, mainly pebbles with up to 5 percent cobbles.

Structure--Subangular blocky, angular blocky or prismatic.

Ashart Series

The Ashart series consists of shallow, well drained soils that formed in residuum derived from tuffaceous rocks. The Ashart soils are on hills. Slopes are 2 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Loamy, mixed, mesic, shallow Mollic Haploxeralfs

Typical pedon: Ashart sandy loam, 2 to 8 percent slopes, is located in an area of map unit 1120. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles.

A--0 to 3 inches; grayish brown (10YR 5/2) sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium platy structure; slightly hard, very friable, nonsticky and nonplastic; common very fine and fine roots; many very fine interstitial and few fine tubular pores; 5 percent pebbles, slightly alkaline (pH 7.4); clear smooth boundary.

E--3 to 7 inches; grayish brown (10YR 5/2) loam, dark grayish brown (10YR 4/2) moist; weak medium platy structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine fine roots; many very fine interstitial, few fine, and medium tubular pores; light brownish gray (10YR 6/2) uncoated sand grains on faces of peds; 5 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

Bt1--7 to 11 inches; brown (10YR 5/3) clay loam, dark brown (10YR 4/3) moist; moderate

medium prismatic structure parting to moderate medium subangular blocky; slightly hard, very friable, moderately sticky and moderately plastic; common very fine and fine roots; common fine tubular pores; common thin clay films lining pores and on mineral grains, continuous thin stress surfaces; many distinct light brownish gray (10YR 6/2) silt coats on tops of prisms; 5 percent pebbles; slightly alkaline (pH 7.8); clear smooth boundary.

Bt2--11 to 15 inches; pale brown (10YR 6/3) clay loam, brown (10YR 5/3) moist; weak medium prismatic structure parting to moderate medium subangular blocky; slightly hard, very friable, moderately sticky and moderately plastic; few very fine and fine roots; common fine tubular pores; many thin clay films on faces of peds and common moderately thick clay films lining pores; 5 percent pebbles; slightly alkaline (pH 7.8); clear smooth boundary.

Cr--15 to 17 inches; soft fractured ashy tuff; strong thick plates with thin lime coats along fractures; violently effervescent.

Type location: Elko County, Nevada; approximately 33 miles east of Jackpot, about 1,500 feet north and 1,000 feet east of the southwest corner of section 26 T. 47 N., R. 70 E.; (41 degrees, 55 minutes, 59 seconds north latitude and 114 degrees, 06 minutes, 24 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in the winter and spring, dry from late June through October.

Soil temperature: 47 to 52 degrees F.

Depth to paralithic contact: 12 to 20 inches.

Control section:

Clay content--20 to 35 percent.

Reaction--Neutral or slightly alkaline.

Rock fragments--0 to 5 percent, mainly pebbles.

A horizon:

Value--5 or 6 dry, 2 or 3 moist.

Chroma--2 or 3

E horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Texture--Sandy loam or loam.

Clay content--10 to 20 percent.

Rock fragments--0 to 15 percent.

Other features--Has uncoated sand grains with value of 6 or 7 dry.

Bt horizons:

Value--5 or 6 dry, 4 or 5 moist.

Chroma--3 or 4.

Texture--Loam or clay loam.

Clay content--20 to 35 percent.

Rock fragments--0 to 5 percent.

Bancy Series

The Bancy series consists of shallow, well drained soils that formed in alluvium derived from volcanic rocks, loess, and volcanic ash. Bancy soils are on plateaus. Slopes are 2 to 15 percent. The mean annual precipitation is about 13 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Clayey, montmorillonitic, frigid, shallow Typic Durixerolls

Typical pedon: Bancy silty clay loam, 2 to 8 percent slopes, is located in an area of the Bancy-Heckison association. (Colors are for dry soil unless otherwise noted.)

A1--0 to 7 inches; brown (10YR 5/3) silty clay loam, dark brown (10YR 3/3) moist; weak medium platy structure; slightly hard, very friable, sticky and plastic; many very fine roots; many very fine and fine tubular and interstitial pores; 5 percent pebbles and 5 percent cobbles; slightly alkaline (pH 7.8); clear smooth boundary.

Bt--7 to 14 inches; pale brown (10YR 6/3) silty clay, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; hard, friable, sticky and plastic; common very fine, fine and medium roots; common very fine and fine tubular pores; many moderately thick clay films on faces of peds and on mineral grains; 5 percent pebbles and 5 percent cobbles of which 3 percent are duripan fragments; slightly alkaline (pH 7.8); abrupt smooth boundary.

Btqk--14 to 18 inches; pale brown (10YR 6/3) cobbly silty clay, dark brown (10YR 3/3) moist; strong medium and coarse subangular blocky structure; very hard, friable, moderately sticky and moderately plastic; few very fine, fine and medium roots; few very fine tubular pores; few

thin clay films on faces of peds; 30 percent firm and very firm durinodes; 15 percent pebbles and 15 percent cobbles of which half are duripan fragments; moderately alkaline (pH 8.4); abrupt smooth boundary.

Bqkm--18 to 26 inches; white (10YR 8/1) indurated duripan with 2 to 25 mm laminar cap; violently effervescent; abrupt wavy boundary.
R--26 inches; welded tuff.

Type location: Elko County, Nevada; approximately 8 miles east of Jackpot, about 2,100 feet east and 3,000 feet north of the southwest corner of section 8, T. 47 N., R. 66 E.; (41 degrees, 58 minutes, 40 seconds north latitude and 114 degrees, 30 minutes, 47 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, moist in winter, dry late June through October.

Soil temperature: 43 to 45 degrees F.

Mollic epipedon thickness: 7 to 12 inches.

Depth to duripan: 14 to 20 inches.

Depth to bedrock: 20 to 40 inches.

Control section:

Clay content--Average 40 to 50 percent.
Reaction--Slightly alkaline or moderately alkaline.

A horizon:

Value--4 or 5 dry.
Chroma--2 or 3.

Bt horizon:

Value--4 through 6 dry.
Chroma--3 or 4.
Structure--Subangular blocky or angular blocky.
Rock fragments--0 to 10 percent, mostly pebbles and cobbles.

Btqk horizon:

Rock fragments--5 to 35 percent, mostly cobbles and stones.

Batan Series

The Batan series consists of very deep, moderately well drained soils that formed in alluvium derived from welded tuff and volcanic ash. Batan soils are on stream terraces, inset fans, and fan skirts.

Slopes are 0 to 4 percent. The mean annual precipitation is about 7 inches and the mean annual temperature is about 49 degrees F.

Taxonomic class: Fine-silty, mixed (calcareous), mesic Durorthidic Torriorthents

Typical pedon: Batan silt loam, 2 to 4 percent slopes, is located in an area of the Geysen-Welch-Batan association. (Colors are for dry soil unless otherwise noted.)

A1--0 to 4 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 4/3) moist; moderate thin and medium platy structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine and few fine roots; many very fine and fine vesicular pores; slightly effervescent; strongly alkaline (pH 8.6); clear smooth boundary.

A2--4 to 9 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 4/3) moist; moderate medium and coarse subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine, fine, and few medium roots; common very fine and fine tubular pores; slightly effervescent; strongly alkaline (pH 8.6); clear smooth boundary.

Bq--9 to 15 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 4/3) moist; moderate medium and coarse angular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; common very fine, fine, and few medium roots; many very fine and fine tubular pores; 5 percent very firm durinodes; strongly effervescent; very strongly alkaline (pH 9.4); clear smooth boundary.

Bqk1--15 to 19 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 4/3) moist; massive, hard, firm, moderately sticky and slightly plastic; few very fine, fine, and medium roots; many very fine, fine, and common medium tubular pores; 20 percent extremely firm durinodes in a discontinuous weakly cemented matrix; common fine rounded and thread like soft lime masses; strongly effervescent; very strongly alkaline (pH 9.4); clear smooth boundary.

Bqk2--19 to 30 inches; pale brown (10YR 6/3) silty clay loam, dark yellowish brown (10YR 4/4) moist, massive; hard, firm, moderately sticky and moderately plastic; few very fine,

fine, and medium roots; many very fine and fine tubular pores; 20 percent extremely firm durinodes in a discontinuous weakly cemented matrix; many fine rounded and thread like soft lime masses; violently effervescent; strongly alkaline (pH 8.6); gradual smooth boundary.

Bqk3--30 to 44 inches; pale brown (10YR 6/3) silt loam, yellowish brown (10YR 5/4) moist; few fine distinct dark yellowish brown (10YR 4/4) mottles; massive; hard, firm, moderately sticky and slightly plastic; few fine and medium roots; many very fine, fine, and few medium tubular pores; 30 percent extremely firm durinodes in a discontinuous weakly cemented matrix; many very fine, fine, and few medium rounded and thread like soft like masses; violently effervescent; strongly alkaline (pH 8.6); gradual smooth boundary.

Bqk4--44 to 60 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 4/3) moist; common fine distinct dark yellowish brown (10YR 4/4) mottles; massive, hard, firm, moderately sticky and slightly plastic; few very fine and fine roots; many very fine, fine, and few medium tubular pores; 30 percent extremely firm durinodes in a discontinuous weakly cemented matrix; few medium rounded and many fine rounded and thread like soft lime masses; violently effervescent; strongly alkaline (pH 8.6).

Type location: Elko County, Nevada; approximately 9 miles south of Contact; about 1,800 feet west and 2,200 feet south of the northeast corner of section 9, T. 43 N., R. 63 E.; (41 degrees, 37 minutes, 43 seconds north latitude and 114 degrees, 50 minutes, 43 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in late May through early November. There is a water table influence at depths immediately below 60 inches.

Soil temperature: 47 to 53 degrees F.

Depth to Bq or Bqk horizon: 9 to 24 inches.

Salt and sodium: Most pedons are salt and sodium affected. Some pedons near drainageways and stream channels lack salt and sodium in the upper horizons.

Mottles: Faint or distinct iron mottles are common in any horizon below 10 inches.

Gypsum: Gypsum crystals are in some pedons below depths of 20 inches.

Control section:

Clay content--20 to 30 percent.

A horizons:

Hue--2.5Y or 10YR.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 through 4.

Reaction--Moderately alkaline through very strongly alkaline.

Other features--Slightly effervescent through violently effervescent.

Bq and Bqk horizons:

Hue--2.5Y or 10YR.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 through 4.

Structure--Angular blocky or massive.

Texture--Silt loam, silty clay loam, but may be stratified fine sandy loam to silty clay in some pedons.

Cementation--20 to 40 percent durinodes.

Some pedons have subhorizons with up to 70 percent discontinuous weak silica cementation.

Reaction--Strongly alkaline or very strongly alkaline.

Other features--Strongly effervescent or violently effervescent.

Belsac Series

The Belsac series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from limestone and dolomite. The Belsac soils are on mountains. Slopes are 15 to 75 percent. The mean annual precipitation is about 16 inches and the mean annual temperature is about 42 degrees F.

Taxonomic class: Loamy-skeletal, mixed Pachic Cryoborolls

Typical pedon: Belsac very gravelly loam, 15 to 50 percent slopes, is located in an area of map unit 560. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; dark grayish brown (10YR 4/2) very gravelly loam, very dark brown (10YR 2/2) moist; weak very fine granular structure; soft,

very friable, slightly sticky and slightly plastic; many very fine and common fine roots; common very fine tubular pores; 40 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

A2--2 to 6 inches; dark grayish brown (10YR 4/2) very gravelly loam, very dark brown (10YR 2/2) moist; moderate medium and coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; common very fine and few fine tubular pores; 35 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

A3--6 to 20 inches; dark grayish brown (10YR 4/2) very gravelly loam, very dark brown (10YR 2/2) moist; moderate medium and coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, few fine, and medium roots; common very fine and few fine tubular pores; few thin strongly effervescent lime coats on pebbles; 40 percent pebbles; noneffervescent matrix; slightly alkaline (pH 7.5); clear wavy boundary.

Bk1--20 to 24 inches; dark grayish brown (10YR 4/2) very gravelly loam, very dark brown (10YR 2/2) moist; moderate medium and coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, few fine, and medium roots; common very fine and few fine tubular pores; thin lime coats on rock fragments; 45 percent pebbles, 2 percent cobbles; strongly effervescent (3 percent calcium carbonate equivalent); slightly alkaline (pH 7.8); clear wavy boundary.

Bk2--24 to 37 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, few fine, and medium roots; few fine tubular pores; thin lime coats cover rock fragments with thin lime pendants on the undersides of rock fragments; 40 percent pebbles, 10 percent cobbles; violently effervescent (10 percent calcium carbonate equivalent); moderately alkaline (pH 8.0); abrupt wavy boundary.

2Cr--37 inches; fractured siltstone with lime coats along fractures with few gypsum crystals.

Type location: Elko County, Nevada; approximately

24 miles north of Wells in the Snake Mountains; about 2,000 feet east and 1,500 feet north of southwest corner of section 14 T. 41 N., R. 61 E.; (41 degrees, 26 minutes, 15 seconds north latitude and 115 degrees, 02 minutes, 33 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, dry late July to October.

Soil temperature: 40 to 45 degrees F.

Average summer soil temperature: 55 to 59 degrees F.

Mollic epipedon thickness: 20 to 40 inches.

Depth to bedrock: 25 to 40 inches.

Depth to carbonates: 20 to 25 inches.

Control section:

Percent clay--18 to 25 percent.

Rock fragments--Averages 35 to 60 percent, mainly pebbles with up to 10 percent cobbles.

A horizons:

Value--4 or 5 dry.

Chroma--2 or 3 moist.

Other features--Few thin lime coats are common on rock fragments in lower subhorizon above the Bk horizon.

Bk1 horizon:

Value--4 or 5 dry.

Chroma--2 or 3 moist.

Reaction--Slightly alkaline or moderately alkaline.

Effervescence--Strongly effervescent or violently effervescent.

Calcium carbonate equivalent--2 to 10 percent.

Bk2 horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Reaction--Slightly alkaline or moderately alkaline.

Effervescence--Strongly effervescent or violently effervescent.

Calcium carbonate equivalent--2 to 10 percent.

Other features--The horizon commonly has thin lime coats that cover rock fragments with thin lime pendants on underside of rock fragments.

Belsac Variant

The Belsac variant consists of very deep, moderately well drained, moderately permeable soils that formed in loess over colluvium from quartzite and sandstone. Belsac variant soils are on mountains. Slopes are 15 to 50 percent. The mean annual precipitation is about 16 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy-skeletal, mixed Entic Cryumbrepts

Typical pedon: Belsac variant very stony silt loam, 15 to 50 percent slopes, is located in an area of map unit 570. (Colors are for dry soil unless otherwise noted.)

Oi--4 to 3 inches; slightly decomposed aspen leaves and twigs.

Oe--3 to 0 inches; decomposed organic litter; few very fine and fine roots.

A1--0 to 9 inches; dark gray (10YR 4/1) very stony silt loam, black (10YR 2/1) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few coarse, common very fine and medium and many fine roots; common very fine interstitial, few very fine and fine tubular pores; 10 percent pebbles, 20 percent cobbles and 20 percent stones; slightly acid (pH 6.1); abrupt wavy boundary.

A2--9 to 29 inches; dark grayish brown (10YR 4/2) extremely cobbly silt loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; few very fine, coarse, common medium, and many fine roots; common very fine interstitial and common fine tubular pores; 15 percent pebbles, 35 percent cobbles and 20 percent stones; moderately acid (pH 5.8); clear wavy boundary.

AC--29 to 41 inches; brown (10YR 5/3) extremely cobbly silt loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common coarse, many fine and medium roots; common very fine interstitial and common fine tubular pores; 10 percent pebbles, 40 percent cobbles and 25 percent stones; moderately acid (pH 6.0); clear wavy boundary.

C--41 to 61 inches; pale brown (10YR 6/3)

extremely cobbly loam, brown (10YR 4/3) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; few coarse, common fine, and medium roots; many very fine interstitial and common fine tubular pores; common thin silt films lining pores and coating rock fragments; 20 percent pebbles, 30 percent cobbles and 20 percent stones; slightly acid (pH 6.2).

Type location: Elko County, Nevada; approximately 22 miles north of Wells about 100 feet east and 2,000 feet south of the northwest corner of section 21, T. 41 N., R. 62 E.; (41 degrees, 25 minutes, 52 seconds north latitude and 114 degrees, 58 minutes, 13 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, dry September and October. Additional moisture is supplied by lateral water movement in the substratum.

Soil temperature: 42 to 45 degrees F.

Average summer soil temperature: 55 to 59 degrees F.

Umbric epipedon thickness: 28 30 to 50 inches.

Base saturation: 30 to 50 percent.

Control section:

Clay content--12 to 20 percent.

Reaction--Medium acid or slightly acid.

Rock fragments--60 to 80 percent, dominantly cobbles and/or stones.

A horizons:

Value--4 or 5 dry; 2 or 3 moist.

C horizon:

Value--5 or 6 dry; 3 or 4 moist.

Structure--Subangular blocky or it is massive.

Texture--Extremely cobbly silt loam, extremely cobbly loam, or extremely stony silt loam.

Bilbo Series

The Bilbo series consists of very deep, well drained soil that formed in alluvium derived from mixed rocks. Bilbo soils are on fan remnants. Slopes are 2 to 50 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, mesic Xerollic Haplargids

Typical pedon: Bilbo very gravelly sandy clay loam, 15 to 50 percent slopes, is located in an area of map unit 270. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent cobbles and 30 percent pebbles.

A--0 to 2 inches; brown (10YR 5/3) very gravelly sandy clay loam, dark brown (10YR 3/3) moist; weak medium platy structure; slightly hard, very friable, moderately sticky and moderately plastic; many very fine roots; many very fine tubular pores; 40 percent pebbles; neutral (pH 6.8); clear smooth boundary.

Bt1--2 to 6 inches; brown (7.5YR 5/4) very gravelly clay, dark brown (7.5YR 3/4) moist; moderate medium subangular blocky structure; very hard, friable, very sticky and very plastic; many very fine and common fine roots; many very fine tubular pores; many thin clay films lining pores, and bridging mineral grains; 50 percent pebbles and 5 percent cobbles; neutral (pH 7.2); clear smooth boundary.

Bt2--6 to 12 inches; brown (7.5YR 5/4) very gravelly sandy clay, dark brown (7.5YR 4/4) moist; moderate medium subangular blocky structure; very hard, firm, moderately sticky and very plastic; few very fine and fine roots; few very fine tubular pores; many moderately thick clay films bridging mineral grains and lining pores; 35 percent pebbles, neutral (pH 7.2); clear smooth boundary.

Bt3--12 to 18 inches; brown (7.5YR 5/4) very gravelly sandy clay, dark brown (7.5YR 4/4) moist; moderate medium subangular blocky structure; very hard, firm, moderately sticky and very plastic; few very fine and fine roots; few very fine tubular pores; many moderately thick clay films lining pores, and bridging mineral grains; 40 percent pebbles, and 5 percent cobbles; neutral (pH 7.2); abrupt smooth boundary.

Bt4--18 to 27 inches; dark yellowish brown (10YR 4/4) extremely gravelly sandy clay, dark yellowish brown (10YR 4/4) moist; massive; hard, firm, moderately sticky and moderately plastic; few very fine roots; few very fine tubular pores; many moderately thick clay films bridging mineral grains, lining pores; 60 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.4); clear smooth boundary.

Bt5--27 to 32 inches; yellowish brown (10YR 5/4) extremely gravelly sandy clay, dark yellowish brown (10YR 4/4) moist, massive; hard, firm, moderately sticky and moderately plastic; few very fine roots; few very fine tubular pores; common thin clay films bridging mineral grains, and lining pores; few moderately thick lime coats on pebbles; 50 percent pebbles, and 20 percent cobbles; slightly alkaline (pH 7.8); clear smooth boundary.

2Bk--32 to 60 inches; yellowish brown (10YR 5/4) very gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; massive; slightly hard, very friable, nonsticky and slightly plastic; few very fine roots; few very fine tubular and common very fine interstitial pores; common thin lime coats on undersides of rock fragments; 40 percent pebbles and 10 percent cobbles; slightly effervescent; slightly alkaline (pH 7.8).

Type location: Elko County, Nevada; approximately 1,700 feet south and 500 feet west of the northeast corner section 28, T. 45 N., R. 61 E.; (41 degrees, 45 minutes, 57 seconds north latitude and 115 degrees, 04 minutes, 14 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry June through October.

Soil temperature: 47 to 51 degrees F.

Combined thickness of A and Bt horizons: 20 to 40 inches.

Depth to carbonates: 20 to 40 inches.

Depth to silica cementation 40 to over 60 inches.

Control section:

Clay content--35 to 50 percent.

Reaction--Neutral to moderately alkaline, normally increasing with depth.

Rock fragments--35 to 60 percent, mainly pebbles with up to 15 percent cobbles in some pedons.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Bt horizons:

Hue--7.5YR or 10YR.

Value--5 or 6 dry, 3 through 5 moist.

Chroma--3 or 4.

Texture--Very gravelly clay, very gravelly sandy

clay, very gravelly clay loam or extremely gravelly sandy clay.

Structure--Prismatic, subangular, or angular blocky or is massive in the lower part.

2Bk horizon:

Value--5 through 8 dry, 4 through 6 moist.

Chroma--2 through 4.

Texture--Extremely gravelly loamy sand or very gravelly sandy loam.

Rock fragments--35 to 75 percent, mainly pebbles.

Bluehill Series

The Bluehill series consists of moderately deep, somewhat excessively drained soils that formed in alluvium and residuum derived from volcanic ash. Bluehill soils are on hills and plateaus. Slopes are 2 to 50 percent. The mean annual precipitation is about 14 inches, and the mean annual temperature is about 47 degrees F.

Taxonomic class: Ashy, mesic Vitrandic Xerochrepts

Typical pedon: Bluehill fine sandy loam, 4 to 15 percent slopes, is located in an area of map unit 990. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 5 percent pebbles.

A--0 to 3 inches; light brownish gray (10YR 6/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium platy structure; slightly hard, very friable, nonsticky and nonplastic; few fine roots; many very fine interstitial pores; 5 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

BA--3 to 8 inches; pale brown (10YR 6/3) fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium platy structure; slightly hard, very friable, slightly sticky and nonplastic; few very fine and common fine roots; many very fine interstitial pores; 5 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

Bw--8 to 11 inches; pale brown (10YR 6/3) fine sandy loam, dark brown (10YR 3/3) moist; massive; slightly hard, very friable, slightly sticky and nonplastic; common fine and medium roots; common very fine interstitial

pores; 5 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

Bk1--11 to 16 inches; very pale brown (10YR 7/3) fine sandy loam, brown (10YR 4/3) moist; massive; slightly hard, very friable, slightly sticky and nonplastic; few fine and medium roots; common very fine tubular pores; 5 percent pebbles; 30 percent soft ash fragments 1/2 to 1 inch in diameter which are lime coated on all sides in a noncalcareous matrix; moderately alkaline (pH 8.2); clear smooth boundary.

Bk2--16 to 26 inches; very pale brown (10YR 7/3) loamy fine sand, brown (10YR 4/3) moist; weak medium and coarse platy structure; hard, firm, nonsticky and nonplastic; few very fine and medium roots; few very fine tubular pores; 5 percent pebbles; 60 percent weakly consolidated soft ash plates, 1/2 to 1 inch thick that are lime coated on all sides; violently effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

2Cr--26 inches; weakly consolidated ashy tuffs.

Type location: Elko County Nevada; approximately 33 miles east of Jackpot; about 2,500 feet east and 2,000 feet south of the northwest corner of section 29, T. 47 N., R. 70 E.; (41 degrees, 56 minutes, 12 seconds north latitude and 114 degrees, 02 minutes, 31 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; dry from mid June through September.

Soil temperature: 47 to 50 degrees F.

Depth to paralithic contact: 20 to 40 inches thick.

Control section:

Clay content--2 to 10 percent.

Rock fragments--0 to 10 percent pebbles 30 to 90 percent soft weakly consolidated ashy tuff fragments 1/2 to 4 inches thick, 1 to 10 inches long.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Reaction--Neutral or slightly alkaline.

Bw horizon:

Value--5 through 7 dry, 3 through 5 moist.

Chroma--2 or 3.

Carbonates--0 to 5 percent calcium carbonate

equivalent.

Reaction--Slightly alkaline or moderately alkaline.

Bk horizons:

Hue--2.5Y or 10YR.

Value--7 or 8 dry, 4 through 6 moist.

Chroma--2 through 4.

Texture--Fine sandy loam or loamy fine sand.

Reaction--Moderately alkaline through very strongly alkaline.

Carbonates--5 to 15 percent calcium carbonate equivalent.

Booford Series

The Booford series consists of moderately deep, well drained soils formed in residuum and colluvium derived from tuffaceous rocks. Booford soils are on hills. Slope is 2 to 50 percent. The mean annual precipitation is about 18 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid Typic Argixerolls

Typical pedon: Booford gravelly clay loam, 2 to 8 percent slopes, is located in an area of map unit 656. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 20 percent pebbles.

A1--0 to 4 inches; grayish brown (10YR 5/2) gravelly clay loam, very dark grayish brown (10YR 3/2) moist; weak medium platy structure; slightly hard, very friable, moderately sticky and moderately plastic; common very fine roots; common very fine interstitial pores; 20 percent pebbles, neutral (pH 6.8); clear wavy boundary.

A2--4 to 9 inches; grayish brown (10YR 5/2) gravelly clay loam, very dark grayish brown (10YR 3/2) moist; moderate medium angular blocky structure; hard, friable, very sticky and moderately plastic; common very fine roots; common very fine interstitial pores; 15 percent pebbles; neutral (pH 6.8); abrupt irregular boundary.

Bt1--9 to 16 inches; grayish brown (10YR 5/2) gravelly clay, dark brown (10YR 3/3) moist; moderate medium prismatic structure; very

hard, very firm, very sticky and very plastic; few very fine, fine, and medium roots; common very fine interstitial pores; many thick clay films on faces of peds; 25 percent pebbles; neutral (pH 6.6); clear wavy boundary.

Bt2--16 to 24 inches; brown (10YR 5/3) gravelly clay, brown (10YR 4/3) moist; moderate medium prismatic structure; very hard, very firm, very sticky and very plastic; few very fine, and medium roots; common very fine interstitial pores; continuous thin stress surfaces; 20 percent pebbles; neutral (pH 6.6); abrupt wavy boundary.

Cr--24 to 35 inches; weathered tuff.

Type location: Elko County, Nevada; approximately 19 miles northeast of Wells in the Windermere Hills; about 2,150 feet east and 925 feet south of the northwest corner of section 12, T. 39 N., R. 64 E.; (41 degrees, 17 minutes, 02 seconds north latitude and 114 degrees, 41 minutes, 14 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, moist in winter and spring; dry in late summer and fall.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 7 to 17 inches thick; includes the upper part of the argillic horizon.

Solum thickness and depth to bedrock: 20 to 40 inches.

Reaction: Slightly acid or neutral.

A horizons:

Value--3 to 5 dry, 2 or 3 moist.

Chroma--1 or 2.

Bt1 horizon:

Hue--10YR or 7.5YR.

Value--4 or 5 dry.

Chroma--2 or 3.

Texture--Silty clay loam or clay.

Clay content--35 to 45 percent.

Rock fragments--5 to 25 percent.

Structure--Angular blocky or prismatic.

Bt2 horizon:

Hue--10YR or 7.5YR.

Value--4 through 6 dry, 3 or 4 moist.

Chroma--3 or 4.

Texture--Clay or silty clay.

Clay content--45 to 60.

Rock fragments--0 to 25 percent.

Structure--Prismatic or massive.

Boso Series

The Boso series consists of shallow, well drained soils that formed in alluvium derived from limestone and dolomite. The Boso soils are on fan remnants. Slopes are 4 to 15 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid, shallow Aridic Petrocalcic Palexerolls

Typical pedon: Boso loam, 8 to 15 percent slopes, is located in an area of map unit 980. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 15 percent pebbles.

A1--0 to 4 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; weak medium and coarse subangular blocky structure; slightly hard, very friable, moderately sticky and moderately plastic; many very fine and few fine roots; many very fine interstitial pores; 10 percent pebbles; slightly alkaline (pH 7.8); clear smooth boundary.

A2--4 to 9 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; moderate coarse subangular blocky structure; slightly hard, very friable, moderately sticky and moderately plastic; common very fine, fine, few medium, and coarse roots; common very fine and fine tubular pores; common medium thick lime pendants on lower sides of pebbles; 10 percent fragments consisting of pebbles and pebble size pan fragments; slightly alkaline (pH 7.8); clear smooth boundary.

Bk--9 to 19 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; slightly hard, very friable, moderately sticky and moderately plastic; common fine and few medium and coarse roots; common very fine and fine tubular pores; many thick lime pendants on lower sides of pebbles; 40 percent coarse fragments consisting of pebbles and pebble size pan fragments; 6 percent calcium carbonate equivalent in the less than 2 millimeter fraction;

strongly effervescent; moderately alkaline (pH 8.0); abrupt smooth boundary.

Bkm--19 to 34 inches; white (10YR 8/2) indurated petrocalcic, with 1 to 8 millimeter laminar lime cap, and a few discontinuous 3 to 10 inch thick pockets of brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; violently effervescent; moderately alkaline (pH 8.0); clear wavy boundary.

2Bky1--34 to 40 inches; very pale brown (10YR 7/3) gravelly loam, yellowish brown (10YR 5/4) moist; massive; hard, friable, slightly sticky and slightly plastic; many thick lime coatings on pebbles; weakly lime cemented; 15 percent pebbles; many very fine and fine gypsum filaments; violently effervescent; moderately alkaline (pH 8.2); clear smooth boundary.

3Bky2--40 to 60 inches; light gray (10YR 7/2) extremely gravelly loam, grayish brown (10YR 5/2) moist; massive; hard, friable, slightly sticky and slightly plastic; many thick lime coats on pebbles; common very fine and fine gypsum filaments; weakly lime cemented; 65 percent pebbles; violently effervescent; moderately alkaline (pH 8.4).

Type location: Elko County, Nevada; approximately 30 miles north of Wells; about 3,200 feet west of the northeast corner of section 31, T. 42 N., R. 61 E.; (41 degrees, 29 minutes, 55 seconds north latitude and 115 degrees, 07 minutes, 05 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, moist in winter and spring, dry from mid-June through early October.

Soil temperature: 45 to 47 degrees F.

Mollic epipedon thickness: 10 to 20 inches.

Depth to petrocalcic horizon: 10 to 20 inches.

Control section:

Clay content--18 to 27 percent.

Rock fragments--35 to 50 percent mainly pebbles and pebblesize pan fragments.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bk horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Texture--Very gravelly loam or very gravelly silt loam.

Clay content--18 to 27 percent.

Rock fragments--35 to 50 percent pebbles and pebble size pan fragments.

Reaction--Slightly alkaline or moderately alkaline.

Carbonates--5 to 15 percent

Bkm horizon:

Value--7 or 8 dry.

Bky horizons:

Texture--Loam to extremely gravelly loam.

Clay content--10 to 18 percent.

Rock fragments--5 to 75 percent, mainly pebbles.

Reaction--Moderately alkaline or strongly alkaline.

Gypsum filaments--Few to many in any one subhorizon.

Bullump Series

The Bullump series consist of deep, well drained soils that formed in colluvium derived from mixed rocks. Bullump soils are on mountains. Slopes are 15 to 50 percent. Mean annual precipitation is about 15 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Pachic Argixerolls

Typical pedon: Bullump very gravelly loam, 30 to 50 percent slopes, is located in an area of map unit 541. (Colors are for dry soils unless otherwise noted.)

A1--0 to 5 inches; very dark grayish brown (10YR 3/2) very gravelly loam, very dark brown (10YR 2/2) moist; strong very fine and fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine interstitial pores; 40 percent pebbles; neutral (pH 7.0); clear smooth boundary.

A2--5 to 11 inches; dark grayish brown (10YR 4/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure parting to strong fine granular;

soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and few medium and coarse roots; many very fine interstitial pores; 45 percent pebbles; neutral (pH 7.0); clear smooth boundary.

BA--11 to 20 inches; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure parting to strong fine granular; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine tubular pores; 45 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt1--20 to 29 inches; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, and few fine tubular pores; common thin clay films bridging and coating mineral grains; 45 percent pebbles and 5 percent cobbles; neutral (pH 7.2); clear wavy boundary.

Bt2--29 to 35 inches; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; few very fine and fine roots; common very fine interstitial, many very fine, and few fine tubular pores; common thin clay films lining pores and on faces of peds; 45 percent pebbles and 5 percent cobbles; neutral (pH 7.2); clear wavy boundary.

Bt3--35 to 47 inches; pale brown (10YR 6/3) very gravelly clay loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; hard, friable, moderately sticky and moderately plastic; few very fine roots; common very fine interstitial and common very fine and few fine tubular pores; common moderately thick, brown (7.5YR 4/4) clay films lining pores, and on faces of peds; few pores are lined by uncoated mineral grains; 50 percent pebbles and 5 percent cobbles; neutral (pH 7.2); abrupt wavy boundary.

2R--47 inches; hard quartzite.

Type location: Elko County, Nevada; approximately 1 mile north of Stormy Canyon in the Snake Mountains; about 2,000 feet west and 250 feet north of the southeast corner of section 21, T. 42 N., R. 61 E.; (41 degrees, 30 minutes, 40 seconds north latitude and 115 degrees, 04 minutes, 28 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry late July to early October. Additional soil moisture may be supplied by lateral water movement in the lower part of the profile.

Soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 20 to 40 inches.

Depth to bedrock: 40 to 80 inches.

Control section:

Clay content--25 to 35 percent.

Reaction--Slightly acid through slightly alkaline.

Other features--Some pedons have a C horizon that is below 40 inches.

Rock fragments--35 to 55 percent, mainly pebbles with some cobbles.

A horizons:

Value--3 through 5 dry, 2 or 3 moist.

Chroma--1 through 3.

Other features--Organic matter 2 to 6 percent.

Bt horizons:

Hue--7.5YR or 10YR.

Value--4 through 6 dry, 2 through 4 moist.

Chroma--2 through 6.

Texture--Very gravelly loam or very gravelly clay loam.

Clay content--25 to 35 percent.

Rock fragments--35 to 55 percent, mainly pebbles.

Structure--Subangular blocky or angular blocky.

Other features--Uncoated mineral grains and few silt coats lining pores occur in some pedons. Some pedons have few distinct mottles or manganese stains on pebbles.

Cameek Series

The Cameek series consists of shallow, moderately well drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. Cameek soils are on fan remnants. Slopes are 2 to 15 percent. Mean annual precipitation is about 11 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Clayey, montmorillonitic, frigid, shallow Aridic Durixerolls

Typical pedon: Cameek silt loam, 4 to 15 percent slopes is located in an area of map unit 270.

(Colors are for dry soils unless otherwise noted.)

A--0 to 2 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; moderate medium and thick platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine and fine vesicular pores; 5 percent pebbles; slightly alkaline (pH 7.6); clear smooth boundary.

Bty--2 to 8 inches; brown (10YR 5/3) clay loam, dark brown (10YR 3/3) moist; moderate thin and medium platy structure; slightly hard, friable, moderately sticky and moderately plastic; many very fine, fine, and common medium roots; common fine tubular pores; common moderately thick clay films on faces of peds, lining pores, and bridging mineral grains; common fine gypsum masses; 5 percent pebbles; slightly alkaline (pH 7.6); clear smooth boundary.

Btqy1--8 to 15 inches; yellowish brown (10YR 5/4) clay, dark yellowish brown (10YR 4/4) moist; strong medium and coarse prismatic structure; hard, firm, very sticky and very plastic; common fine and medium roots; few fine tubular pores; many stress surfaces and many moderately thick clay films lining pores and bridging mineral grains; common fine and few medium threadlike and soft masses of gypsum; few very fine and fine manganese stains on faces of peds; many moderately thick silica coats on undersides of pebbles; 10 percent pebbles; slightly alkaline (pH 7.6); clear smooth boundary.

Btqy2--15 to 19 inches; yellowish brown (10YR 5/4) gravelly clay, dark yellowish brown (10YR 4/4) moist; few medium faint brown (10YR 5/3) mottles, common medium organic stains and few very fine and fine manganese stains on faces of peds; weak medium prismatic structure parting to moderate fine and medium subangular blocky; hard, firm, very sticky and very plastic; common fine roots; few fine tubular pores; 20 percent discontinuous weak silica cementation; many moderately thick silica coats on undersides of pebbles; many stress surfaces and many moderately thick clay films lining pores and bridging mineral grains; common fine and medium threadlike and soft masses of gypsum; 30 percent pebbles; slightly alkaline (pH 7.6); abrupt wavy boundary.

Bqm1--19 to 24 inches; strongly cemented duripan with a 0.5 to 1.0 millimeter thick discontinuous

silica laminae; strong thick platy structure; common very fine and fine manganese stains on horizontal plate surfaces; abrupt wavy boundary.

Bqm2--24 to 42 inches; indurated duripan with a 2 to 7 millimeter thick continuous silica laminar cap; abrupt wavy boundary.

2Cy--42 to 60 inches; pale brown (10YR 6/3) extremely cobbly sandy loam, dark yellowish brown (10YR 4/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; common fine interstitial pores; many very fine and few fine threadlike and soft masses of gypsum; 50 percent pebbles, 35 percent cobbles; slightly alkaline (pH 7.8)

Type location: Elko County, Nevada; approximately 25 miles north of the Cottonwood Ranch in the O'Neil Basin; about 2,000 feet north and 2,500 feet east of the southwest corner of section 30, T. 45 N., R. 61 E.; (41 degrees, 45 minutes, 40 seconds north latitude and 115 degrees, 07 minutes, 03 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in the winter and spring, dry late June through October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 7 to 12 inches, commonly includes the upper part of the argillic horizon.

Depth to duripan: 14 to 20 inches.

Control section:

Clay content--Averages 40 to 55 percent.

Rock fragments--Averages 10 to 35 percent.

A horizon:

Chroma--2 or 3.

Bty horizon:

Value--4 or 5 dry, 2 through 4 moist.

Chroma--2 through 4.

Texture--Clay loam or gravelly clay.

Clay content--30 to 45 percent.

Rock fragments--5 to 25 percent.

Structure--Platy or subangular blocky.

Other features--Gypsum masses and/or threads are present in most pedons.

Btqy horizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--3 or 4.

Texture--Clay, gravelly clay, or gravelly sandy clay.

Clay content--40 to 60 percent.

Rock fragments--10 to 35 percent.

Structure--Prismatic, angular blocky or subangular blocky.

Silica cementation--Undersides of pebbles are coated with silica; the lower subhorizons have up to 30 percent discontinuous weak silica cementation.

Mottles--Few faint mottles may be absent in some pedons.

Other features--Gypsum masses and threads are present in most pedons.

Bqm horizons:

Thickness of the laminae--0.5 to 7.0 mm.

2C horizon:

Rock fragments--35 to 50 percent pebbles, 25 to 35 percent cobbles.

Cavehill Series

The Cavehill series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from limestone and dolomite. Cavehill soils are on mountains. Slopes are 15 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy-skeletal, carbonatic, frigid Typic Calcixerolls

Typical pedon: Cavehill very gravelly silt loam, 15 to 50 percent slopes, is located in an area of map unit 2030. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles and 5 percent cobbles.

Oi--1 to 0 inches; slightly decomposed pine needles and twigs; clear wavy boundary.

A1--0 to 4 inches; grayish brown (10YR 5/2) very gravelly silt loam, very dark grayish brown (10YR 3/2) moist; weak very fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and few fine roots; many very fine interstitial pores; 50 percent pebbles; moderately alkaline (pH 8.0); clear wavy boundary.

A2--4 to 9 inches; grayish brown (10YR 5/2) very gravelly silt loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and few medium roots; many very fine interstitial pores; thin lime coats on undersides of rock fragments; 40 percent pebbles and 5 percent cobbles; strongly effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

A3--9 to 17 inches; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine interstitial pores; few thick lime coats on undersides of rock fragments; 45 percent pebbles and 5 percent cobbles; violently effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

Bk--17 to 33 inches; white (10YR 8/2) very gravelly loam, pale brown (10YR 6/3) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; few fine roots; common very fine and fine interstitial pores; discontinuous weak lime cementation and many thick lime coats covering rock fragments with thin lime pendants on undersides of rock fragments; 45 percent pebbles, 5 percent cobbles, and 5 percent stones; violently effervescent; strongly alkaline (pH 8.6); abrupt irregular boundary.

2R--33 inches; hard, fractured limestone.

Type location: Elko County, Nevada; approximately 8 miles northwest of Montello; about 1,000 feet east and 130 feet south of the northwest corner of section 28, T. 40 N., R. 68 E.; (41 degrees, 19 minutes, 53 seconds north latitude and 114 degrees, 17 minutes, 40 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; dry from about mid July through mid October.

Soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 14 to 20 inches.

Depth to bedrock: 20 to 40 inches.

Control section:

Clay content--18 to 27 percent.

Carbonates--Averages 40 to 60 percent calcium carbonate equivalent with the upper part

ranging from 15 to 50 percent and the lower part ranging from 50 to 80 percent.

Reaction--Moderately alkaline or strongly alkaline.

Rock fragments--35 to 60 percent, mainly pebbles and cobbles, with stones common in some pedons.

A horizons:

Value--4 or 5 dry.

Chroma--2 or 3.

Effervescence--Effervescent after mixing to a depth of 7 inches in horizons above 10 inches and strongly effervescent or violently effervescent below 10 inches.

Other features--Thick lime pedants are on some rock fragments in the lower A horizon in some pedons.

Bk horizon:

Value--6 through 8 dry, 4 through 7 moist.

Chroma--2 or 3.

Textures--Very gravelly silt loam, very gravelly loam, very cobbly loam or very cobbly silt loam.

Rock fragments--Averages 35 to 60 percent.

Some pedons have thin subhorizons directly above the bedrock that are gravelly loam with 25 to 35 percent pebbles and cobbles.

Structure--Subangular blocky or it is massive.

Other features--Weak discontinuous lime cementation and thin to thick lime coats and pendants on undersides of rock fragments.

Chayson Series

The Chayson series consists of moderately deep to a indurated duripan, well drained soils that formed in alluvium derived mainly from volcanic rocks and volcanic ash. Chayson soils are on fan remnants. Slopes are 2 to 15 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Fine-loamy, mixed, frigid Typic Durixerolls

Typical pedon: Chayson loam, 4 to 15 percent slopes, is located in an area of map unit 195. (Colors are for dry soil unless otherwise noted.)

A--0 to 3 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; weak medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine tubular pores; slightly alkaline (pH 7.4); abrupt smooth boundary.

Bt1--3 to 12 inches; grayish brown (10YR 5/2) clay loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, and medium roots; many very fine and fine tubular pores; few moderately thick clay films lining pores, on faces of peds, and bridging mineral grains; 5 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

Bt2--12 to 20 inches; light brownish gray (10YR 6/2) clay loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine and medium roots; common very fine and fine tubular pores; few thin clay films lining pores on faces of peds and bridging mineral grains; few thin lime coats on pebbles; 5 percent pebbles; slightly effervescent; slightly alkaline (pH 7.8); clear wavy boundary.

Bk--20 to 36 inches; light brownish gray (10YR 6/2) gravelly loam, brown (10YR 4/3) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine, few fine, and medium roots; common very fine tubular pores; 15 percent pebbles; violently effervescent; strongly alkaline (pH 8.6); abrupt wavy boundary.

Bqkm--36 to 60 inches; light gray (10YR 7/2) indurated duripan; 1 to 2 millimeter thick continuous laminae.

Type location: Elko County, Nevada; approximately 14 miles east of Jackpot; about 2,500 feet east and 2,000 feet north of the southwest corner of section 28 T. 47 N., R. 67 E.; (41 degrees, 56 minutes, 05 seconds north latitude and 114 degrees, 22 minutes, 24 second west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; dry from about mid July through mid October; moist mid October to mid July.

Soil temperature: 44 to 46 degrees F.

Mollic epipedon: 10 to 17 inches.

Depth to duripan: 20 to 40 inches.

Control section:

Clay content--24 to 34 percent.

Rock fragments--0 to 30 percent, mainly pebbles.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Value--5 or 6 dry, 3 or 4 moist

Chroma--2 through 4.

Texture--Clay loam, loam or silty clay loam

Rock fragments--0 to 30 percent, mainly pebbles

Bk horizon:

Value--6 or 7 dry, 4 or 5 moist.

Texture--Clay loam or loam

Rock fragments--0 to 30 percent, mainly pebbles

Reaction--Moderately alkaline or strongly alkaline.

Carbonates--Calcium carbonate equivalent 15 to 30 percent

Bqkm horizon:

Value--7 or 8 dry

Other features--Typically has fractures 10 to 20 inches apart. Thickness of the duripan is 8 to 24 inches

Chen Series

The Chen series consists of well drained soils that formed in residuum and colluvium derived from mixed rocks. Chen soils are on hills and mountains. Slopes are 4 to 50 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, frigid Lithic Argixerolls

Typical pedon: Chen very gravelly loam, 30 to 50 percent slope, is located in an area of map unit 749. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 65 percent pebbles.

A1--0 to 2 inches; brown (10YR 5/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak thin platy structure parting to strong fine granular; soft, very friable, moderately sticky and moderately plastic; many very fine, few fine, and medium roots; many very fine interstitial, and common very fine tubular pores; 35 percent pebbles; neutral (pH 7.2); clear wavy boundary.

A2--2 to 6 inches; brown (10YR 5/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; strong fine granular structure; slightly hard, very friable, sticky and plastic; many very fine, few fine, and medium roots; many very fine interstitial pores; 45 percent pebbles; neutral (pH 7.2); abrupt smooth boundary.

Bt1--6 to 8 inches; brown (10YR 5/3) very gravelly clay, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; hard, friable, very sticky and very plastic; common very fine and few fine and medium roots; common very fine interstitial and tubular pores; common thin clay films on faces of peds and lining pores; 45 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt2--8 to 12 inches; brown (10YR 5/3) very gravelly clay, dark brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, firm, very sticky and very plastic; common very fine, few fine, and medium roots; common very fine interstitial and many fine tubular pores; common thin clay films on faces of peds and lining pores; 50 percent pebbles; neutral (pH 7.2); abrupt irregular boundary.

2R--12 inches; hard, fractured chert.

Type location: Elko County, Nevada; approximately 7 miles southwest of Boies Reservoir; about 2,250 feet east and 2,400 feet south of the northwest corner of section 21, T. 42 N., R. 62.; (41 degrees, 30 minutes, 59 seconds north latitude and 114 degrees, 57 minutes, 46 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring, dry mid June through October.

Soil temperature: 43 to 47 degrees.

Mollic epipedon thickness: 7 to 17 inches and generally includes all of the upper part of the argillic horizon.

Depth to bedrock: 12 to 20 inches.

Reaction: Slightly acid through slightly alkaline throughout.

A horizons:

Value--4 through 6 dry (less than 5.5 when the surface 7 inches are mixed), 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Hue--7.5YR or 10YR with 5YR common in areas with high iron concentrations in the parent material.

Value--4 or 5 dry, 3 or 4 moist.

Chroma--2 through 4.

Texture--Very gravelly clay, extremely gravelly clay, very cobbly clay, extremely cobbly clay; some pedons have thin Bt1 horizons of very gravelly clay loam with 35 to 40 percent clay.

Clay content--40 to 55 percent.

Rock fragments--40 to 65 percent pebbles and cobbles normally increasing with depth.

Structure--Weak to strong, fine or medium angular or subangular blocky or platy.

Chiara Series

The Chiara series consists of shallow, well drained, moderately permeable soils that formed in loess and volcanic ash over alluvium. The Chiara soils are on fan remnants. Slopes are 2 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Loamy, mixed, mesic, shallow Xerollic Durorthids

Typical pedon: Chiara silt loam, 2 to 4 percent slopes, is located in an area of map unit 171. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 15 percent pebbles.

A1--0 to 2 inches; light brownish gray (10YR 6/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate very thin platy structure; slightly hard, friable, nonsticky and nonplastic; common very fine roots; common very fine vesicular pores, common very fine and fine tubular pores; 5 percent pebbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

A2--2 to 4 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; weak medium subangular blocky structure; slightly hard, very friable, nonsticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; 5 percent pebbles; slightly alkaline (pH 7.6); clear smooth boundary.

Bw--4 to 9 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine, fine, and few medium roots; common very fine and fine tubular pores; 5 percent pebbles; moderately alkaline (pH 8.0); clear wavy boundary.

Bqk--9 to 14 inches; light brownish gray (10YR 6/2) silt loam, brown (10YR 4/3) moist; massive; slightly hard, friable, nonsticky and slightly plastic; common very fine and few fine roots; common very fine interstitial and few fine tubular pores; 20 percent 1 inch in diameter durinodes; 5 percent pebbles; few thin lime coats on durinodes; strongly effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

2Bqkm--14 to 34 inches; white (10YR 8/2) indurated duripan with a 2 to 5 millimeter thick silica laminar cap, pale brown (10YR 6/3) moist; massive; extremely hard, extremely firm; moderately alkaline (pH 8.4); abrupt wavy boundary.

3Bqkm--34 to 61 inches; white (10YR 8/2) indurated duripan, pale brown (10YR 6/3) moist; silica laminae 2 to 4 millimeters thick; 20 percent pebbles; few discontinuous lenses of gravelly loamy fine sand; violently effervescent; moderately alkaline (pH 8.4).

Type location: Elko County, Nevada; approximately 4 miles north of Wells; about 2,500 feet north and 1,900 feet west of the southeast corner of section 28, T. 38 N., R. 62 E.; (41 degrees, 08 minutes, 45 seconds north latitude and 114 degrees, 58 minutes, 16 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, dry, from June through October, but are moist in winter and spring.

Soil temperature: 47 to 53 degrees F.

Depth to indurated duripan: 10 to 20 inches.

Control section:

Clay content--5 to 18 percent.

Rock fragments--0 to 5 percent pebbles when mixed.

Other features--Gravel and sand substratum are below a depth of 40 inches in some pedons.

A horizons:

Value--3 or 4 moist.

Chroma--2 or 3.

Reaction--Neutral through moderately alkaline.

Bw horizon:

Value--6 or 7 dry, 3 through 5 moist.

Chroma--3 or 4.

Texture--Very fine sandy loam, loam or silt loam with 70 to 85 percent silt plus very fine sand.

Structure--Weak to strong, fine to coarse subangular blocky or weak prismatic.

Reaction--Slightly alkaline to strongly alkaline.

Bqk horizon:

Durinodes--20 to 60 percent ranging from .3 to 1 inch in diameter.

Texture--Very fine sandy loam, loam or silt loam with 70 to 85 percent silt plus very fine sand.

Reaction--Moderately alkaline or strongly alkaline.

Bqkm horizons:

Value--6 through 8 dry, 5 through 7 moist.

Chroma--2 through 4.

Structure--Massive or thick platy.

Chuska Series

The Chuska series consists of shallow to an indurated duripan, well drained soils that formed in alluvium derived from volcanic rocks. Chuska soils are on fan remnants. Slopes are 2 to 15 percent. The mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy, mixed, mesic, shallow Xerollic Durargids

Typical pedon: Chuska gravelly loam, 2 to 8 percent slopes is located in an area of map unit 250. (Colors are for dry soil unless otherwise

noted.) The soil surface is partially covered by 10 percent pebbles and 1 percent cobbles.

A1--0 to 1 inch; pale brown (10YR 6/3) gravelly loam, dark brown (10YR 3/3) moist; weak, thin platy structure; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; common very fine tubular pores; 15 percent pebbles; moderately alkaline (pH 7.9); abrupt smooth boundary.

A2--1 to 3 inches; pale brown (10YR 6/3) gravelly loam, dark brown (10YR 3/3) moist; moderate medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; common very fine tubular pores; 15 percent pebbles; moderately alkaline (pH 7.9); abrupt smooth boundary.

Bt--3 to 7 inches; pale brown (10YR 6/3) gravelly clay loam, dark yellowish brown (10YR 4/4) moist; weak coarse subangular blocky structure parting to moderate fine subangular blocky; hard, firm, moderately sticky and moderately plastic; common very fine, fine and medium roots; common very fine and fine tubular pores; common thin clay films lining pores and bridging mineral grains; few thin lime coats on undersides of pebbles; 25 percent pebbles; moderately alkaline (pH 8.0); abrupt smooth boundary.

Btk--7 to 12 inches; very pale brown (10YR 7/3) gravelly loam, dark yellowish brown (10YR 4/4) moist; moderate fine and medium subangular blocky structure; very hard, firm, slightly sticky and slightly plastic; few very fine, fine and medium roots; few very fine tubular pores; common thin and moderately thick clay films on faces of peds and lining pores; many lime coats on undersides of pebbles; 30 percent pebbles, and duripan fragments; slightly effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

Bqkm--12 to 22 inches; very pale brown (10YR 7/3) indurated duripan with a continuous 2 to 5 mm silica laminar cap brown (10YR 5/3) moist; massive; extremely hard, extremely firm; violently effervescent; abrupt wavy boundary.

2Bqk--22 to 28 inches; very pale brown (10YR 7/3) extremely gravelly loamy sand, brown (10YR 5/3) moist; massive, loose, nonsticky and nonplastic; few very fine and fine roots; many very fine interstitial pores; many moderately thick lime pendants on undersides of rock fragments; 60 percent pebbles and

duripan fragments; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

2Bk--28 to 53 inches; very pale brown (10YR 7/3) extremely gravelly loamy sand, brown (10YR 5/3) moist; massive; loose, nonsticky and nonplastic; few very fine and fine roots; many very fine and fine interstitial pores; continuous thin and moderately thick lime coats on pebbles; 60 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

R--53 inches; welded tuff.

Type location: Elko County, Nevada; approximately 5 miles southeast of Jackpot; about 2,000 feet east and 2,000 feet north of the southwest corner of section 25, T. 46 N., R. 65 E.; (41 degrees, 50 minutes, 38 seconds north latitude and 114 degrees, 33 minutes, 05 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; dry from about June through October, but are moist in the winter and spring.

Soil temperature: 48 to 50 degrees F.

Depth to bedrock: 40 to 60 inches.

Depth to indurated duripan: 12 to 20 inches.

Control section:

Clay content--26 to 35 percent.

Rock fragments--15 to 35 percent, mainly pebbles.

A horizons:

Value--5 or 6 dry, 3 or 4 moist

Chroma--2 or 3.

Bt horizon:

Value--6 or 7 dry, 3 or 4 moist

Chroma--2 through 4

Texture--Gravelly clay loam, gravelly loam.

Reaction--Moderately alkaline or strongly alkaline.

Cleavage Series

The Cleavage series consists of shallow, well drained soils that formed in residuum and colluvium from mixed rocks. Cleavage soils are on hills and mountains. Slopes are 4 to 75 percent.

The mean annual precipitation is about 14 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Lithic Argixerolls

Typical pedon: Cleavage very gravelly loam, 4 to 15 percent slopes, is located in an area of map unit 743. (Colors are for dry soil unless otherwise noted). The soil surface is partially covered with 50 percent pebbles.

A1--0 to 3 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak thick platy structure; slightly hard, very friable, nonsticky and nonplastic; many very fine roots; many very fine and common fine vesicular pores; 45 percent pebbles, neutral (pH 7.3); clear wavy boundary.

A2--3 to 7 inches; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; common very fine interstitial and tubular pores; 35 percent pebbles, neutral (pH 7.3); clear wavy boundary.

BA--7 to 10 inches; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; slightly hard; friable, slightly sticky and slightly plastic; common very fine roots; common very fine few fine tubular pores; 40 percent pebbles, slightly alkaline (pH 7.4); clear wavy boundary.

Bt--10 to 18 inches; pale brown (10YR 6/3) extremely gravelly clay loam, brown (10YR 4/3) moist; moderate fine subangular blocky structure; hard, firm, moderately sticky and moderately plastic; common very fine roots, common very fine and fine tubular pores; 55 percent pebbles, 5 percent cobbles; common thin clay films lining pores and on faces of peds; slightly alkaline (pH 7.4); abrupt irregular boundary.

2R--18 inches; fractured chert.

Type location: Elko County, Nevada; approximately 20 miles north of Wells; about 1,700 feet west and 2,500 feet south of the northeast corner of section 34, T. 41 N., R. 62 E.; (41 degrees, 24 minutes, 01 seconds north latitude and 114 degrees, 56 minutes, 23 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry from July through October for 70 to 120 consecutive days.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 7 to 10 inches, does not include Bt horizon.

Depth to bedrock: 14 to 20 inches.

Control section:

Clay content--20 to 35 percent.

Rock fragments--50 to 80 percent, mostly pebbles or cobbles.

Reaction--Neutral or slightly alkaline.

A horizons:

Value--4 or 5 dry 2 or 3 moist.

Chroma--2 or 3.

BA horizon:

Chroma--2 through 4.

Texture--Very cobbly loam or very gravelly loam.

Bt horizon:

Hue--7.5YR or 10YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--3 or 4.

Texture--Very cobbly clay loam, extremely cobbly clay loam, very gravelly clay loam, or extremely gravelly clay loam, very gravelly sandy clay loam, some pedons have very cobbly loam or very gravelly loam.

Structure--Subangular blocky or angular blocky or it is massive.

Cobre Series

The Cobre series consists of moderately deep, well drained soils that formed in residuum and colluvium from pyroclastic and volcanic rocks. The Cobre soils are on pediments and hills. Slopes are 2 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Ashy, mesic Durixerollic Calciorthids

Typical pedon: Cobre silt loam, 4 to 15 percent slopes, in an area of map unit 3031. (Colors are for dry soil unless otherwise noted.)

- A1--0 to 1 inch; light gray (2.5Y 7/2) silt loam, dark grayish brown (2.5Y 4/2) moist; weak medium platy structure; slightly hard, very friable, moderately sticky and slightly plastic; few very fine roots; many very fine interstitial, many very fine, fine, and few coarse vesicular pores; 10 percent pebbles; slightly effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.
- A2--1 to 2 inches; light gray (2.5Y 7/2) silt loam, dark grayish brown (2.5Y 4/2) moist; moderate medium platy structure; slightly hard, very friable, moderately sticky and slightly plastic; few very fine roots; many very fine interstitial, many very fine, and fine vesicular pores; 10 percent pebbles; slightly effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.
- Bw1--2 to 6 inches; light gray (2.5Y 7/2) silt loam, grayish brown (2.5Y 5/2) moist; weak medium and coarse subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine and few fine roots; many very fine interstitial and few very fine tubular pores; 10 percent pebbles; strongly effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.
- 2Bw2--6 to 13 inches; light gray (2.5Y 7/2) loam, grayish brown (2.5Y 5/2) moist; weak medium and coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, few medium and coarse roots; many very fine interstitial pores; 10 percent pebbles; strongly effervescent; moderately alkaline (pH 8.2); clear wavy boundary.
- 2Bqk1--13 to 25 inches; white (2.5Y 8/2) sandy loam, light brownish gray (2.5Y 6/2) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky and nonplastic; many very fine, fine and few medium roots; many very fine interstitial pores; 50 percent hard 1 to 2 inch diameter durinodes; thin lime coats on undersides of rock fragments; 10 percent pebbles; strongly effervescent; moderately alkaline (pH 8.4); clear wavy boundary.
- 2Bqk2--25 to 29 inches; white (2.5Y 8/2) sandy loam, light brownish gray (2.5Y 6/2) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial and few very fine tubular pores; 60 percent hard 1 to 2 inch diameter durinodes; thin lime and silica coats lining tubular pores;

10 percent pebbles; strongly effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

2Cr1--29 to 31 inches; light gray (2.5Y 7/2) ash tuff, grayish brown (2.5Y 5/2) moist; few very fine roots along fracture planes; thin lime and silica coats lining fracture planes; slightly effervescent; gradual wavy boundary.

2Cr2--31 to 41 inches; light gray (2.5Y 7/2) ash tuff, grayish brown (2.5Y 5/2) moist; slightly effervescent.

Type location: Elko County, Nevada; approximately 2 miles north of Cobre; about 250 feet west and 600 feet south of northeast corner of section 32 T. 38 N., R. 67 E.; (41 degrees, 08 minutes, 25 seconds north latitude and 114 degrees, 24 minutes, 42 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry mid-June through October for 70 to 100 consecutive days.

Soil temperature: 47 to 52 degrees F.

Depth to paralithic contact: 20 to 40 inches.

Depth to horizons containing durinodes: 11 to 25.

Control section:

Clay content--Averages 8 to 18 percent.

Reaction--Slightly alkaline or moderately alkaline.

Volcanic ash--65 to 80 percent.

Rock fragments--0 to 15 percent, mainly ash tuff pebbles.

A horizons:

Hue--10YR or 2.5Y.

Value--5 through 7 dry, 3 or 4 moist.

Chroma--2 or 3.

Effervescence--Noneffervescent or slightly effervscent.

Bw horizons:

Hue--10YR or 2.5Y.

Value--5 through 7 dry, 3 through 5 moist.

Chroma--2 or 3.

Texture--Silt loam, loam or very fine sandy loam.

Clay content--15 to 25 percent.

Rock fragments--0 to 15 percent, mainly ash tuff pebbles.

Structure--Subangular blocky or angular blocky.

Effervescence--Noneffervescent to strongly effervescent.

Bq or Bqk horizons:

Hue--2.5Y, 5Y or 10YR.

Value--6 through 8 dry, 4 through 6 moist.

Chroma--2 or 3.

Texture--Sandy loam, fine sandy loam or loam.

Clay content--8 to 18 percent.

Rock fragments--Averages 0 to 15 percent; some thin subhorizons range up to 25 percent ashly tuff pebbles.

Structure--Subangular blocky or it is massive.

Effervescence--Noneffervescent to strongly effervescent.

Contact Series

The Contact series consists of very deep, somewhat excessively drained soils that formed in colluvium derived from granitic rocks. The Contact soils are on hills. Slopes are 15 to 30 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Sandy, mixed, frigid Entic Haploxerolls

Typical pedon: Contact gravelly loamy coarse sand, 15 to 30 percent slopes, is located in an area of the Shalper-Contact-Rock outcrop association. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles.

A1--0 to 7 inches; dark grayish brown (10YR 4/2) gravelly loamy coarse sand, very dark grayish brown (10YR 3/2) moist; weak coarse subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; many very fine, few fine, medium, and coarse roots; common very fine tubular pores; 30 percent pebbles; slightly effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

A2--7 to 18 inches; grayish brown (10YR 5/2) gravelly loamy coarse sand, very dark grayish brown (10YR 3/2) moist; weak coarse subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common very fine, few fine, medium, and coarse roots; common very fine tubular pores; 30 percent

pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

AC--18 to 34 inches; pale brown (10YR 6/3) gravelly loamy coarse sand, dark brown (10YR 3/3) moist; massive; slightly hard, very friable, nonsticky and nonplastic; common very fine and few fine, medium and coarse roots; common very fine tubular pores; 30 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

C--34 to 60 inches; pale brown (10YR 6/3) gravelly coarse sand, brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; common very fine and few fine roots; common very fine interstitial pores; 30 percent pebbles; moderately alkaline (pH 8.2).

Type location: Elko County, Nevada, approximately 4.5 miles southwest of Contact; about 600 feet west and 1,200 feet north of the southeast corner of section 35, T. 45 N., R. 63 E.; (41 degrees, 44 minutes, 24 seconds north latitude and 114 degrees, 48 minutes, 03 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry from about mid June through October.

Soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 10 to 18 inches thick.

Depth to bedrock: 60 to over 80 inches.

Control section:

Clay content--1 to 7 percent.

Reaction--Slightly alkaline or moderately alkaline.

Rock fragments--20 to 35 percent pebbles, more than 50 percent are 2 to 5 millimeters size fragments.

A horizons:

Value--4 or 5 dry.

Chroma--2 or 3.

Effervescence--Noneffervescent or slightly effervescent.

AC horizon:

Value--5 or 6 dry.

Chroma--2 or 3.

Texture--Gravelly loamy coarse sand, gravelly coarse sand or gravelly loamy sand.

Clay content--1 to 5 percent.

Rock fragments--20 to 35 percent.

Structure--Subangular blocky or it is massive.

C horizon:

Value--3 or 4 moist.

Chroma--2 or 3.

Texture--Gravelly loamy coarse sand, gravelly coarse sand or gravelly loamy sand.

Clay content--1 to 5 percent.

Rock fragments--20 to 35 percent.

Other features--Some pedons have slight effervescence in the lower part.

Coser Series

The Coser series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from mixed rocks. The Coser soils are on hills and piedmonts. Slopes are 4 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid Typic Palexerolls

Typical pedon: Coser gravelly clay loam, 4 to 15 percent slopes, is located in an area of map unit 060. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 70 percent pebbles.

A--0 to 4 inches; grayish brown (10YR 5/2) gravelly clay loam, very dark grayish brown (10YR 3/2) moist; weak thin platy structure; hard, friable, moderately sticky and moderately plastic; many very fine roots; many very fine, fine, and few medium vesicular pores; 25 percent pebbles; neutral (pH 6.8); abrupt wavy boundary.

Bt1--4 to 8 inches; grayish brown (10YR 5/2) clay, very dark grayish brown (10YR 3/2) moist; moderate coarse angular blocky structure; hard, friable, very sticky and very plastic; common very fine and few fine roots; common very fine and few fine tubular pores; common thin clay films on faces of peds and lining pores; 5 percent pebbles; neutral (pH 6.8); abrupt smooth boundary.

Bt2--8 to 16 inches; brown (10YR 4/3) clay, dark brown (10YR 3/3) moist; strong medium prismatic structure; very hard, very firm, very sticky and very plastic; common very fine exped roots, few fine and medium inped roots; few very fine tubular pores; continuous

pressure faces; 10 percent pebbles; neutral (pH 6.8); abrupt wavy boundary.

2Bt3--16 to 22 inches; light brownish gray (2.5Y 6/2); gravelly clay, dark grayish brown (2.5Y 4/2) moist; moderate fine and medium prismatic structure; very hard, very firm, very sticky and very plastic common very fine exped roots; few very fine interstitial pores; common moderately thick clay films on faces of peds; about 20 percent of horizon has rock structure; 10 percent pebbles, 5 percent cobbles; neutral (pH 7.3); abrupt smooth boundary.

2Bt4--22 to 28 inches; light gray (2.5Y 7/2) silty clay; grayish brown (2.5Y 5/2) moist; weak fine and medium prismatic structure; very hard, very firm, very sticky and very plastic; common very fine roots; few very fine pores; many pressure faces; about 35 percent of horizon has rock structure; neutral (pH 7.3); clear wavy boundary.

2Cr--28 to 61 inches; light gray (2.5Y 7/2) soft calcareous tuffaceous saprolite, few very fine roots along fracture planes; violently effervescent.

Type location: Elko County, Nevada; approximately 21 miles north of Wells near Antelope Peak; about 900 feet south and 250 feet east of the northwest corner of section 1, T. 40 N., R. 61 E.; (41 degrees, 23 minutes, 23 seconds north latitude and 115 degrees, 02 minutes, 19 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, dry from about mid-July to October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 13 to 20 inches; includes upper part of Bt horizon.

Depth to paralithic contact: 20 to 40 inches.

Control section:

Clay content--50 to 60 percent.

Rock fragments--5 to 20 percent, mainly pebbles.

A horizon:

Value--4 or 5 dry.

Chroma--2 or 3.

Bt horizons:

Value--4 or 5 dry, 3 or 4 moist.

Chroma--2 or 3.

Texture--Clay or gravelly clay.

Clay content--50 to 60 percent.
Structure--Moderate or strong angular blocky or prismatic.

2Bt horizons:

Hue--2.5Y or 10YR.
Value--6 or 7 dry, 4 or 5 moist.
Chroma--2 through 4.
Texture--Silty clay, clay, or gravelly clay.
Clay content--45 to 55 percent.
Structure--Weak to strong angular blocky or prismatic.
Reaction--Neutral or slightly alkaline.
Other features--Commonly has 10 to 40 percent rock structure.

prismatic structure; hard, firm, very sticky and very plastic; common very fine and fine roots; few very fine tubular pores; common moderately thick clay films on faces of peds and lining pores; 5 percent pebbles; neutral (pH 7.2); gradual wavy boundary.

2Cr--12 inches; weathered tuff; common clay films along fracture planes.

Type location: Elko County, Nevada; approximately 15 miles southwest of Jackpot; about 1,500 feet west and 2,000 feet south of the northeast corner of section 33, T. 47 N., R. 62 E.; (41 degrees, 55 minutes, 11 seconds north latitude and 114 degrees, 57 minutes, 08 seconds west longitude.)

Cotant Series

The Cotant series consists of shallow, well-drained soils formed in residuum and colluvium derived from mixed rocks. Cotant soils are on hills and pediments. Slopes are 4 to 30 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 42 degrees F.

Taxonomic class: Clayey, montmorillonitic, frigid, shallow Aridic Argixerolls

Typical pedon: Cotant very gravelly loam, 4 to 15 percent slopes, is located in an area of map unit 820. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles.

A--0 to 3 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak moderately thick platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine tubular pores; 35 percent pebbles; neutral (pH 6.8); clear smooth boundary.

Bt1--3 to 8 inches; grayish brown (10YR 5/2) clay, very dark grayish brown (10YR 3/2) moist; weak medium prismatic structure; hard, firm, very sticky and very plastic; common very fine and fine roots, few very fine tubular pores; common moderately thick clay films on faces of peds and lining pores; 5 percent pebbles; neutral (pH 7.0); clear smooth boundary.

Bt2--8 to 12 inches; brown (10YR 5/3) clay, brown (10YR 4/3) moist; weak medium

Range in Characteristics:

Soil moisture: Usually moist; moist in winter and spring, dry July through October.

Soil temperature: 42 to 47 degrees F.

Mollic epipedon thickness: 7 to 14 inches, including upper part of argillic horizon.

Depth to paralithic contact: 12 to 20 inches.
Reaction--Neutral or slightly alkaline.

A horizon:

Chroma--2 or 3.

Bt horizon:

Value--4 through 6 dry, 3 through 5 moist.

Chroma--2 or 3.

Texture--Dominantly clay, gravelly clay common in some subhorizons.

Clay content--40 to 60 percent.

Rock fragments--0 to 15 percent, mainly pebbles; up to 25 percent common in some subhorizons.

Structure--Prismatic or angular blocky.

Croesus Series

The Croesus series consists of moderately deep, well drained soils that formed in residuum and colluvium from sedimentary rocks. The Croesus soils are on mountains. Slopes are 30 to 75 percent. The mean annual precipitation is about 18 inches and the mean annual temperature is about 42 degrees F.

Taxonomic class: Loamy-skeletal, mixed Pachic Cryoborolls

north latitude and 115 degrees, 00 minutes, 59 seconds west longitude.)

Typical pedon: Croesus extremely stony loam, 30 to 75 percent slopes, is located in an area of map unit 1010. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 40 percent pebbles, 15 percent cobbles, and 25 percent stones.

Range in Characteristics:

Soil moisture: Usually moist; dry from August to October.

Soil temperature: 42 to 45 degrees F.

Average summer soil temperature: 55 to 59 degrees F.

Mollic epipedon thickness: 20 to 40 inches.

Depth to bedrock: 20 to 40 inches.

Control section:

Percent clay--10 to 18 percent.

Rock fragments--Averages 50 to 70 percent including 10 to 20 percent cobbles and stones.

A1--0 to 3 inches; dark brown (10YR 4/3) extremely stony loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, few medium, and coarse roots; many very fine interstitial pores; 45 percent pebbles; 10 percent cobbles and 20 percent stones; neutral (pH 7.3); clear wavy boundary.

A horizons:

Hue--7.5YR or 10YR.

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Texture--Sandy loam, or loam.

Reaction--Slightly acid through slightly alkaline, increasing with depth

A2--3 to 9 inches; dark brown (10YR 4/3) extremely gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, few fine, medium, and coarse roots; many very fine and common fine tubular pores; 50 percent pebbles, 5 percent cobbles and 15 percent stones; neutral (pH 7.3); clear wavy boundary.

Crooked Creek Series

The Crooked Creek series consists of very deep, poorly drained soils that formed in alluvium derived from mixed rocks. The Crooked Creek soils are on floodplains. Slopes are 0 to 2 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 44 degrees F.

A3--9 to 18 inches; brown (10YR 5/3) extremely gravelly loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, few medium, and coarse roots; many very fine and common fine tubular pores; 45 percent pebbles, 10 percent cobbles and 5 percent stones; neutral (pH 7.3); clear wavy boundary.

Taxonomic class: Fine, montmorillonitic, frigid Cumulic Haplaquolls

A4--18 to 28 inches; brown (10YR 5/3) extremely gravelly sandy loam, dark brown (10YR 3/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine, medium and coarse roots; many very fine and common fine tubular pores; few thin lime coats on undersides of rock fragments; 55 percent pebbles, 10 percent cobbles and 5 percent stones; slightly alkaline (pH 7.5); abrupt wavy boundary.

Typical pedon: Crooked Creek silty clay loam, drained, rarely flooded, 0 to 2 percent slopes, is located in an area of map unit 211. (Colors are for dry soil unless otherwise noted.)

2R--28 inches; fractured quartzite bedrock.

A1--0 to 3 inches; dark gray (10YR 4/1) silty clay loam, black (10YR 2/1) moist; weak very fine granular structure; slightly hard, friable, moderately sticky and moderately plastic; many very fine and few fine roots; few very fine interstitial pores; neutral (pH 7.3); abrupt smooth boundary.

A2--3 to 12 inches; dark gray (10YR 4/1) silty clay loam, black (10YR 2/1) moist; weak medium

Type location: Elko County, Nevada; approximately 23 miles north of Wells in the Snake Mountains; about 900 feet south and 1,800 feet west of the northeast corner of section 13, T. 41 N., R. 61 E.; (41 degrees, 26 minutes, 54 seconds

subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; many very fine and common fine roots; many very fine interstitial and common fine tubular pores; slightly alkaline (pH 7.6); clear smooth boundary.

A3--12 to 18 inches; dark gray (10YR 4/1) silty clay loam, black (10YR 2/1) moist; weak medium prismatic structure parting to moderate fine subangular blocky; hard, firm, moderately sticky and moderately plastic; common very fine and few fine roots; many very fine interstitial pores; slightly alkaline (pH 7.6); abrupt smooth boundary.

A4--18 to 29 inches; dark gray (10YR 4/1) silty clay, black (10YR 2/1) moist; few fine distinct dark yellowish brown (10YR 4/4) mottles; weak medium prismatic structure parting to strong fine angular blocky; hard, firm, very sticky and very plastic; few very fine roots; common very fine interstitial pores; slightly alkaline (pH 7.5); abrupt smooth boundary.

A5--29 to 38 inches; gray (10YR 5/1) silty clay, very dark gray (10YR 3/1) moist; few fine prominent olive (5Y 4/3) mottles; moderate medium subangular blocky structure parting to strong fine angular blocky; hard, firm, very sticky and very plastic; few very fine roots; few very fine interstitial pores; slightly alkaline (pH 7.6); clear wavy boundary.

C1--38 to 48 inches; gray (10YR 6/1) silty clay loam, very dark gray (10YR 3/1) moist; common fine prominent olive (5Y 4/3) moist mottles; weak coarse subangular blocky structure parting to moderate fine angular blocky; hard, firm, very sticky and very plastic; few very fine interstitial pores; slightly alkaline (pH 7.5); clear smooth boundary.

C2--48 to 61 inches; light gray (5Y 7/2) silty clay loam, dark gray (5Y 4/1) moist; many large prominent olive (5Y 5/3) and dark greenish gray (5G 4/1) moist mottles; massive; hard, firm, very sticky and very plastic; slightly alkaline (pH 7.5).

Type location: Elko County, Nevada; approximately 19 miles northeast of Wells in the Windermere Hills; 950 feet east and 1,000 feet south of the northwest corner of section 30, T. 39 N., R. 65 E.; (41 degrees, 14 minutes, 23 seconds north latitude and 114 degrees, 40 minutes, 17 seconds west longitude.)

Range in Characteristics:

Soil moisture: The soil is saturated at or near the surface for a least one month during most years.

Soil temperature: 43 to 45 degrees F.

Mollic epipedon thickness: Greater than 24 inches.

Control section:

Clay content--Averages 35 to 50 percent.

Rock fragments--Averages 0 to 10 percent.

A horizons:

Value--3 through 5 dry, 1 through 3 moist.

Chroma--1 or 2.

Other features--Most subhorizons have faint to distinct mottles.

C horizons:

Hue--10YR, 7.5YR, 5Y or 2.5Y

Value--3 through 6 dry, 3 through 5 moist.

Chroma--1 through 4.

Texture--Clay loam, silty clay loam, silt loam.

Clay content--Averages 30 to 40 percent.

Rock fragments--Averages 0 to 10 percent.

Structure--Subangular blocky or it is massive.

Other features--These horizons have distinct or prominent mottles with hue of 7.5YR through 5G.

Dacker Series

The Dacker series consists of moderately deep, well drained soils that formed in alluvium derived from mixed rocks loess and volcanic ash. The Dacker soils are on fan remnants. Slopes are 2 to 8 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 49 degrees F.

Taxonomic class: Fine-loamy, mixed, mesic Xerollic Durargids

Typical pedon: Dacker silt loam, 2 to 4 percent slopes, is located in an area of map unit 160. (Colors are for dry soil unless otherwise noted.)

A1--0 to 3 inches; light brownish gray (10YR 6/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate thin platy structure; slightly

hard, very friable, moderately sticky and slightly plastic; many very fine roots; many very fine and common fine vesicular pores; slightly alkaline (pH 7.6); clear smooth boundary.

A2--3 to 7 inches; light brownish gray (10YR 6/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, moderately sticky and slightly plastic; many very fine roots; common very fine tubular pores; slightly alkaline (pH 7.6); clear smooth boundary.

Bt1--7 to 11 inches; pale brown (10YR 6/3) silty clay loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, very friable, very sticky and moderately plastic; many very fine roots; common very fine and few fine tubular pores; common thin clay films on faces of peds and lining pores; 5 percent pebbles; slightly alkaline (pH 7.6); clear smooth boundary.

Bt2--11 to 17 inches; pale brown (10YR 6/3) silty clay loam, brown (10YR 4/3) moist; moderate fine subangular blocky structure; hard, friable, very sticky and moderately plastic; common very fine roots; common very fine and few fine tubular pores; few thin clay films lining pores; 5 percent pebbles; slightly alkaline (pH 7.6); clear smooth boundary.

Bqk--17 to 22 inches; very pale brown (10YR 7/3) silt loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; hard, friable, very sticky and very plastic; common very fine roots; common very fine interstitial pores; 20 percent 5 to 10 millimeter in diameter hard durinodes; few thin lime coats on durinodes and on undersides of pebbles; 5 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.

2Bqkm--22 to 42 inches; white (10YR 8/2) continuous indurated duripan with 2 to 5 millimeter laminar cap, very pale brown (10YR 7/4) moist; massive; extremely hard, extremely firm; violently effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

3Cqk--42 to 61 inches; light gray (10YR 7/2) very gravelly loamy sand, brown (10YR 5/3) moist; massive; very hard, friable, nonsticky and nonplastic; alternating with continuous and discontinuous strongly cemented layers; 50 percent pebbles; violently effervescent; moderately alkaline (pH 8.4).

Type location: Elko County, Nevada; approximately 4 miles north of Wells; about 1,800 feet north

and 400 feet east of the southwest corner of section 19, T. 38 N., R. 63 E.; (41 degrees, 09 minutes, 41 seconds north latitude and 114 degrees, 54 minutes, 16 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the winter and spring dry June through October.

Soil temperature: 47 to 52 degrees F.

Combined thickness of A and Bt: 17 to 25 inches.

Depth to carbonates: 15 to 25 inches.

Depth to duripan: 20 to 35 inches.

Control section:

Clay content--27 to 35 percent.

Rock fragments--5 to 35 percent pebbles.

A horizon:

Chroma--2 or 3.

Reaction--Neutral or slightly alkaline.

Bt horizons:

Value--6 or 7 dry, 3 through 5 moist.

Chroma--3 or 4.

Texture--Upper subhorizon is silty clay loam or gravelly silty clay loam. Lower subhorizon is silt loam, silty clay loam or gravelly silt loam.

Clay content--Upper subhorizon 27 to 35 percent, lower subhorizons 25 to 33 percent.

Rock fragments--Upper subhorizons 5 to 20 percent

Lower subhorizons--5 to 35 percent.

Structure--Prismatic, subangular blocky, may be massive in the lower part.

Consistence--Usually hard, slightly hard in subhorizons.

Reaction--Slightly alkaline or moderately alkaline.

Bqk horizon:

Value--6 or 7 dry, 3 through 5 moist.

Chroma--3 or 4.

Texture--Silt loam, some pedons have gravelly silt loam.

Clay content--20 to 25 percent.

Rock fragments--5 to 35 percent pebbles.

Other features--20 to 50 percent, 5 to 30 millimeter durinodes.

Bqkm horizon:

Value--7 or 8 dry, 5 through 7 moist.

Chroma--2 through 4.

Other features--Commonly has variable thickness of alternating layers of weak, strong or indurated silica-lime cemented material below.

Deleplain Series

The Deleplain series consists of very deep, very poorly drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. The Deleplain soils are on flood plains. Slopes are 0 to 2 percent. The mean annual precipitation is about 8 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic Aeric Fluvaquents

Typical pedon: Deleplain silt loam, 0 to 2 percent slopes, is located in an area of map unit 187. (Colors are for dry soil unless otherwise noted.)

A--0 to 3 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; moderate thin platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine and medium roots; few very fine and fine vesicular pores; 5 percent pebbles; slightly effervescent; moderately alkaline (pH 8.0); clear smooth boundary.

C1--3 to 8 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; few fine distinct pale brown (10YR 6/3) mottles, brown (10YR 4/3) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine and medium roots; common very fine and fine tubular pores; 5 percent pebbles; strongly effervescent; moderately alkaline (pH 8.0); clear smooth boundary.

C2--8 to 21 inches; light gray (10YR 7/2) silt loam, dark grayish brown (10YR 4/2) moist; common fine distinct light yellowish brown (10YR 6/4) mottles, dark yellowish brown (10YR 4/6) and brownish yellow (10YR 6/6) moist; moderate medium subangular blocky; soft, very friable, moderately sticky and slightly plastic; common very fine, fine, and medium roots; many very fine and common fine and few medium tubular pores; 5 percent pebbles; violently effervescent;

moderately alkaline (pH 8.2); clear wavy boundary.

Cq--21 to 34 inches; light brownish gray (10YR 6/2) gravelly silt loam, dark grayish brown (10YR 4/2) and very dark grayish brown (10YR 3/2) moist; few fine distinct pale brown (10YR 6/3) mottles, brown (10YR 4/3) moist; massive; slightly hard, friable, slightly sticky and plastic; common very fine and few fine and medium roots; many very fine and common fine tubular pores; 10 percent weak discontinuous silica cementation; 15 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

2Cq--34 to 51 inches; light brownish gray (10YR 6/2) gravelly loamy coarse sand, dark grayish brown (10YR 4/2) moist; few fine distinct pale brown (10YR 6/3) mottles; brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; 10 percent weak discontinuous silica cementation; 20 percent pebbles; moderately alkaline (pH 8.0); abrupt wavy boundary.

3C--51 to 60 inches; light brownish gray (10YR 6/2) extremely gravelly coarse sand, dark grayish brown (10YR 4/2) moist; few fine prominent brownish yellow (10YR 6/6) mottles, dark yellowish brown (10YR 4/4) moist; single grain; loose, nonsticky and nonplastic; common very fine and few fine roots; 60 percent pebbles; slightly alkaline (pH 7.8).

Type location: Elko County, Nevada; approximately 5 miles south of Jackpot, in the Salmon Falls Creek drainage; about 1,320 feet east of the northwest corner of section 35, T. 47 N., R. 64 E.; (41 degrees, 55 minutes, 32 seconds north latitude and 114 degrees, 41 minutes, 24 seconds west longitude.)

Range in Characteristics:

Soil moisture: Saturated at some depth between 6 to 18 inches for at least one month or more during late winter through early summer. During late summer and fall the depth to the water table is 40 to 60 inches unless drained.

Soil temperature: 47 to 52 degrees F.

Depth to contrasting textures: 25 to 37 inches.

Control section:

Clay content--Averages 18 to 27 percent in the upper part.

Rock fragments--Averages 5 to 25 percent, mainly pebbles.
 Clay content--Averages 8 to 15 percent in the lower part.
 Rock fragments--10 to 70 percent, mainly pebbles.
 Other features--Averages less than 50 percent very fine sand.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.
 Structure--Thin or medium platy.

C or Cq horizons:

Value--6 or 7 dry.
 Texture--Stratified silt loam or gravelly silt loam.
 Clay content--Averages 18 to 27 percent.
 Rock fragments--Up to 25 percent, mainly pebbles.
 Structure--Fine or medium subangular blocky.
 Effervescence--Strongly effervescent or violently effervescent.
 Mottles--Few or common in any subhorizon.
 Cementation--5 to 15 percent weak discontinuous.

2Cq horizon:

Value--6 or 7 dry.
 Clay content--Averages 5 to 10 percent.
 Rock fragments--15 to 25 percent.
 Mottles--Few to common, distinct or prominent.
 Cementation--5 to 15 percent weak discontinuous.

3C horizon:

Texture--Stratified very gravelly coarse sand to extremely gravelly coarse sand.
 Mottles--Few or common, distinct or prominent.
 Rock fragments--50 to 70 percent, mainly pebbles.
 Clay content--5 to 10 percent.

Devilsgait Series

The Devilsgait series consists of very deep, very poorly drained soils that formed in alluvium derived from mixed rocks, loess and volcanic ash. The Devilsgait soils are on floodplains. Slopes are 0 to 4 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Fine-silty, mixed (calcareous), mesic Cumulic Haplaquolls

Typical pedon: Devilsgait silt loam, drained, rarely flooded, 0 to 2 percent slopes, is located in an area of map unit 480. (Colors are for dry soils unless otherwise noted.)

A1--0 to 2 inches; dark gray (10YR 4/1) silt loam, very dark gray (10YR 3/1) moist; common fine distinct yellowish red (5YR 4/6) moist mottles; moderate medium platy structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; moderately alkaline (pH 8.2); abrupt smooth boundary.
 A2--2 to 9 inches; dark gray (10YR 4/1) silt loam, black (10YR 2/1) moist; common fine distinct strong brown (7.5YR 4/6) moist mottles; moderate medium subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine, fine, few medium, and coarse roots; common very fine tubular pores; slightly effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.
 A3--9 to 12 inches; dark gray (10YR 4/1) silty clay loam, black (10YR 2/1) moist; common fine distinct strong brown (7.5YR 4/6) moist mottles; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; common very fine, fine, and few medium roots; common very fine tubular pores; slightly effervescent; strongly alkaline (pH 9.0); clear wavy boundary.
 A4--12 to 24 inches; gray (10YR 5/1) silty clay loam, black (10YR 2/1) moist; common fine distinct yellowish red (5YR 4/6) moist mottles; moderate fine prismatic structure parting to moderate fine subangular blocky; hard, firm, very sticky and very plastic; common very fine and fine roots; common very fine tubular pores; violently effervescent in lime filaments; common medium lime filaments and soft masses; strongly effervescent matrix; strongly alkaline (pH 8.6); abrupt wavy boundary.
 A5--24 to 31 inches; gray (10YR 5/1) silty clay loam, black (10YR 2/1) moist; common fine distinct yellowish red (5YR 4/6) moist mottles; weak fine subangular blocky structure; slightly hard, very friable, moderately sticky and moderately plastic; common very fine and fine roots; common very fine tubular pores; few fine gypsum crystals; few fine lime filaments and

soft masses; strongly effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

C--31 to 37 inches; light gray (10YR 6/1) silt loam, very dark gray (10YR 3/1) moist; many fine faint dark grayish brown (10YR 4/2) and few fine distinct yellowish red (5YR 4/6) moist mottles; weak medium subangular blocky structure; slightly hard, very friable, moderately sticky and moderately plastic; common very fine and few fine roots; many very fine tubular pores; few fine lime seams and masses; strongly effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.

Ab1--37 to 43 inches; gray (10YR 5/1) silty clay loam, black (10YR 2/1) moist; few medium distinct yellowish red (5YR 4/6) moist mottles; moderate fine prismatic structure; hard, firm, very sticky and very plastic; common very fine roots; many very fine tubular pores; few fine lime filaments and soft masses; slightly effervescent; moderately alkaline (pH 7.9); abrupt smooth boundary.

C¹--43 to 61 inches; light brownish gray (2.5Y 6/2) silty clay loam, grayish brown (2.5Y 5/2) moist; common medium distinct light olive brown (2.5Y 5/4) and few fine distinct yellowish red (5YR 4/6) moist mottles; strong coarse prismatic structure; hard, firm, very sticky and very plastic; few very fine roots; common very fine tubular pores; few fine lime filaments and soft masses; slightly effervescent; moderately alkaline (pH 7.9).

Type location: Elko County, Nevada; approximately 26 miles north of Wells; about 2,000 feet east and 2,500 feet north of the southwest corner of section 7, T. 41 N., R. 64 E.; (41 degrees, 27 minutes, 10 seconds north latitude and 114 degrees, 46 minutes, 27 seconds west longitude.)

Range in Characteristics:

Soil moisture: Saturated at or near the surface for at least one month during most years, mainly during the late winter through early summer months.

Soil temperature: 47 to 50 degrees F.

Mollic epipedon thickness: 24 to 50 inches.

Control section:

Clay content--20 to 35 percent.

Reaction--Slightly alkaline or moderately alkaline, with some pedons strongly alkaline in the upper part.

Other features--Some pedons have a gravelly substratum below depths of 40 inches. Some pedons are drained due to stream channel entrenchment.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--1 or 2.

Other features--Buried A horizons occur in some pedons.

C horizon:

Hue--10YR, 2.5Y or 5Y.

Value--3 through 5 moist.

Chroma--1 or 2.

Texture--Stratified silt loam and silty clay loam.

Some pedons have thin strata of silty clay or loam in the lower part.

Dewar Series

The Dewar series consists of shallow, well drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. Dewar soils are on fan remnants. Slopes are 2 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Loamy, mixed, mesic, shallow Xerollic Durargids

Typical pedon: Dewar gravelly silt loam, 2 to 8 percent slopes, is located in an area of map unit 131. (Colors are for dry soil unless otherwise noted.)

A--0 to 2 inches; light brownish gray (10YR 6/2) gravelly silt loam, very dark grayish brown (10YR 3/2) moist; moderate very thin platy structure breaking to strong very fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine, few fine roots; many very fine interstitial pores; 30 percent pebbles; slightly alkaline (pH 7.4); abrupt smooth boundary.

Bt1--2 to 6 inches; pale brown (10YR 6/3) gravelly clay loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; slightly hard, very friable, moderately sticky and moderately plastic; many very fine, fine, few medium, and coarse roots; many very fine interstitial pores; many thin clay films lining

pores and on faces of peds and as colloid stains on mineral grains; 20 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

Bt2--6 to 14 inches; very pale brown (10YR 7/3) gravelly clay loam, brown (10YR 4/3) moist; moderate fine subangular blocky structure; hard, friable, moderately sticky and moderately plastic; many very fine, common fine, medium and coarse roots; common very fine interstitial and tubular pores; many thin clay films lining pores and on faces of peds; 30 percent pebbles; slightly alkaline (pH 7.6); abrupt wavy boundary.

Bqkm1--14 to 30 inches; white (10YR 8/2) indurated duripan; massive; very rigid; few very fine roots in fractures; common thin clay films on duripan surface; violently effervescent; clear wavy boundary.

Bqkm2--30 to 60 inches; white (10YR 8/2) strongly silica cemented duripan with 1 to 2 inch discontinuous layers of extremely gravelly coarse sand; massive; extremely hard and slightly rigid; few very fine roots in fractures; very thin to thin lime and silica pendants on the undersides of pebbles; violently effervescent.

Type location: Elko County, Nevada; approximately 25 miles north of Wells; about 1,000 feet north and 250 feet west of the southeast corner of section 24, T. 42 N., R. 62 E.; (41 degrees, 30 minutes, 41 seconds north latitude and 114 degrees, 53 minutes, 49 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring, dry early June through October.

Soil temperature: 47 to 52 degrees F.

Depth to indurated duripan: 14 to 20 inches.

Reaction: A and Bt horizons are neutral to moderately alkaline.

A horizon:

Chroma--2 or 3.

Bt horizons:

Value--6 or 7 dry, 3 or 4 moist.

Chroma--2 through 4 dry, 3 or 4 moist.

Texture--Gravelly silty clay loam or gravelly clay loam.

Clay content--27 to 35 percent.

Rock fragments--15 to 30 percent, mainly pebbles.

Structure--Weak through strong, fine through coarse subangular blocky.

Bqkm horizons:

Structure--Massive or has moderately thick or very thick plate-like layers.

Cementation--Some pedons are alternately strongly cemented or discontinuously indurated horizons below the indurated duripan.

Other features--In some pedons, a 1 to 3 inch zone of degraded duripan material is common along the upper horizon boundary.

Donna Series

The Donna series consists of well drained soils that are moderately deep to a duripan. These soils formed in alluvium derived from mixed rocks, loess, and volcanic ash. Donna soils are on fan remnants. Slopes are 2 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Very-fine, montmorillonitic, frigid Abruptic Aridic Durixerolls

Typical pedon: Donna extremely cobbly clay loam, 4 to 15 percent slope, is located in an area of map unit O20. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 40 percent pebbles, 20 percent cobbles, and 5 percent stones.

A1--0 to 3 inches; grayish brown (10YR 5/2) extremely cobbly clay loam, very dark grayish brown (10YR 3/2) moist; massive; slightly hard, very friable, moderately sticky and moderately plastic; many very fine, common fine and few medium roots; common very fine tubular pores; 35 percent pebbles, 35 percent cobbles and 5 percent stones; neutral (pH 7.0); clear wavy boundary.

A2--3 to 7 inches; grayish brown (10YR 5/2) very gravelly clay loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; many very fine, common fine and few medium roots; common very fine and few fine tubular pores; 35 percent pebbles, 10 percent cobbles and 5

percent stones; neutral (pH 7.0); clear wavy boundary.

- AB--7 to 11 inches; brown (10YR 5/3) very gravelly clay loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine and fine, and few medium roots; 35 percent pebbles and 10 percent stones; neutral (pH 7.0); abrupt smooth boundary.
- Bt1--11 to 19 inches; brown (7.5YR 5/4) clay, dark brown (7.5YR 4/4) moist; strong medium prismatic structure; very hard, very firm, very sticky and very plastic; few very fine roots; few very fine interstitial pores; many stress surfaces; 5 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.
- Bt2--19 to 21 inches; brown (7.5YR 5/4) clay, brown (7.5YR 5/4) moist; moderate medium prismatic structure; very hard, very firm, very sticky and very plastic; few very fine roots; few very fine interstitial pores; many stress surfaces; 5 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.
- Bqkm1--21 to 38 inches; reddish yellow (7.5YR 7/6) indurated duripan with continuous 3 to 5 millimeters thick silica laminar cap; massive; very rigid; strongly effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.
- Bqkm2--38 to 41 inches; reddish yellow (7.5YR 7/6) indurated duripan with continuous 5 to 10 millimeters thick silica laminar cap; massive; very rigid; strongly effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.
- 2Bqk--41 to 60 inches; pale brown (10YR 6/3) stratified very gravelly sandy loam and very gravelly sandy clay loam, brown (10YR 4/3) moist; massive; hard, firm, slightly sticky and slightly plastic; discontinuous weakly silica and lime cemented; averages 45 percent pebbles; strongly effervescent; slightly alkaline (pH 7.6).

Type location: Elko County, Nevada; approximately 22 miles north of Wells; about 700 feet south and 1,200 feet east of the northwest corner of section 33, T. 41 N., R. 61 E.; (41 degrees, 24 minutes, 19 seconds north latitude and 115 degrees, 05 minutes, 03 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring, dry mid June through October.

Soil temperature: 44 to 47 degrees F.
Mollic epipedon thickness: 7 to 12 inches.
Depth to duripan: 20 to 36 inches.
Thickness of duripan: 10 to 20 inches.
Control section:

- Clay content--60 to 70 percent.
- Rock fragments--0 to 15 percent, mainly pebbles.
- Other features--There is an increase of 15 to 30 percent clay at the upper boundary of the Bt horizon.

A horizons:

- Value--5 or 6 dry, 3 or 4 moist; (6 dry and 4 moist only in the surface 1 to 3 inches.)
- Chroma--2 or 3.
- Reaction--Slightly acid or neutral.

Bt horizons:

- Hue--10YR or 7.5YR.
- Value--5 or 6 dry, 4 or 5 moist.
- Chroma--3 or 4.
- Structure--Weak through strong medium or coarse prismatic, parting to angular blocky, massive in the lower part.
- Consistence--Very hard or extremely hard, dry.
- Reaction--Slightly acid or neutral. Some pedons are slightly alkaline immediately above the duripan.

Bqm and Bqkm horizons:

- Reaction--Neutral or slightly alkaline where the upper subhorizons lack carbonates; moderately alkaline or strongly alkaline in the calcareous portions.
- Other features--Commonly noncalcareous in the upper part but few or common fine soft lime seams are along fracture planes in some pedons.

2Bqk horizon:

- Texture--Stratified extremely gravelly sandy loam to gravelly sandy clay loam.
- Rock fragments--Averages 35 to 65 percent, mainly pebbles.
- Reaction--Slightly alkaline or moderately alkaline.

Earcree Series

The Earcree series consists of very deep, well drained soils that formed in colluvium derived from

granitic rocks. Earcree soils are on mountains. Slopes are 30 to 50 percent. The mean annual precipitation is about 16 inches and the mean annual temperature is about 39 degrees F.

Taxonomic class: Coarse-loamy, mixed Pachic Cryoborolls

Typical pedon: Earcree gravelly coarse sandy loam, 30 to 50 percent slopes, is located in an area of map unit 300. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 20 percent pebbles and 5 percent cobbles.

A1--0 to 3 inches; dark grayish brown (10YR 4/2) gravelly coarse sandy loam, black (10YR 2/1) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; many very fine tubular pores; 20 percent pebbles; moderately acid (pH 6.0); clear smooth boundary.

A2--3 to 19 inches; dark grayish brown (10YR 4/2) gravelly coarse sandy loam, black (10YR 2/1) moist; massive; slightly hard, friable, nonsticky and nonplastic; many very fine and common fine roots; common very fine tubular and many fine interstitial pores; 20 percent pebbles; slightly acid (pH 6.2); gradual smooth boundary.

A3--19 to 31 inches; dark grayish brown (10YR 4/2) gravelly coarse sandy loam, black (10YR 2/1) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine, common fine and few medium roots; few very fine tubular and many fine interstitial pores; 20 percent pebbles; slightly acid (pH 6.4); gradual smooth boundary.

A4--31 to 36 inches; dark grayish brown (10YR 4/2) gravelly coarse sandy loam, very dark brown (10YR 2/2) moist; massive; slightly hard, very friable, nonsticky and nonplastic; many very fine, few fine, and medium roots; few very fine tubular and many fine interstitial pores; 20 percent pebbles; slightly acid (pH 6.1); gradual smooth boundary.

C--36 to 60 inches; light brownish gray (2.5Y 6/2) gravelly loamy coarse sand, dark grayish brown (2.5Y 4/2) moist; massive; slightly hard, very friable, nonsticky and nonplastic; common fine and few medium roots; many fine interstitial pores; 20 percent pebbles; slightly acid (pH 6.1).

Type location: Elko County, Nevada; approximately 10 miles southeast of Contact in an unsectioned area; about 3,000 feet south and 3,400 feet west of the top of Granite Peak; (41 degrees, 41 minutes, 44 seconds north latitude and 114 degrees, 42 minutes, 02 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; dry late July through September.

Soil temperature: 38 to 43 degrees F.

Average summer temperature: 52 to 59 degrees F.

Mollic epipedon thickness: 30 to 50 inches.

Control section:

Clay content--10 to 18 percent.

Reaction--Neutral to moderately acid.

Rock fragments--5 to 35 percent, mainly pebbles.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--1 or 2.

C horizon:

Hue--2.5Y or 5Y.

Value--6 or 7 dry, 4 through 6 moist.

Chroma--2 through 4.

Texture--Gravelly sandy loam, very gravelly loamy coarse sand, gravelly loamy coarse sand, gravelly coarse sandy loam or loamy coarse sand.

Rock fragments--10 to 45 percent

Eboda Series

The Eboda series consists of moderately deep, well drained soils that formed in loess over residuum and colluvium derived from mixed rocks. Eboda soils are on side slopes of hills. Slopes are 4 to 15 percent. Mean annual precipitation is about 13 inches, and the mean annual temperature is about 43 degrees F.

Taxonomic class: Fine-loamy, mixed, frigid Aridic Argixerolls

Typical pedon: Eboda loam, 4 to 15 percent slopes, is located in an area of map unit 820.

(Colors are for dry soils unless otherwise noted.)

A1--0 to 3 inches; dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; weak medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine tubular pores; 5 percent pebbles; neutral (pH 7.0); abrupt smooth boundary.

A2--3 to 9 inches; dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; 5 percent pebbles; neutral (pH 7.0); clear smooth boundary.

Bt1--9 to 17 inches; brown (10YR 5/3) loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and few fine roots; common very fine tubular pores; few thin clay films on faces of peds and lining pores; 5 percent pebbles; neutral (pH 7.0); clear smooth boundary.

Bt2--17 to 30 inches; brown (10YR 5/3) loam, dark brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; few very fine and fine roots; common very fine tubular pores; few thin clay films on faces of peds and lining pores; 5 percent pebbles; neutral (pH 7.0); clear smooth boundary.

C--30 to 37 inches; pale brown (10YR 6/3) gravelly loam, dark brown (10YR 4/3) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; common very fine and fine tubular pores; 15 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Cr--37 inches; weathered tuff.

Type location: Elko County, Nevada; approximately 15 miles southwest of Jackpot; about 1,500 feet west and 500 feet north of the southeast corner of section 28, T. 47 N., R. 62 E.; (41 degrees, 55 minutes, 38 seconds north latitude and 114 degrees, 57 minutes, 15 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry July through October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 10 to 17 inches.

Commonly includes the upper part of the argillic horizon.

Combined thickness of A and Bt horizons: 19 to 33 inches.

Depth to paralithic contact: 23 to 40 inches.

Control section:

Clay content--25 to 35 percent.

Reaction--Neutral or slightly alkaline.

Rock fragments--5 to 15 percent, mainly pebbles.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 through 4.

Structure--Moderate to strong angular or subangular blocky, moderate prismatic in some subhorizon of most pedons.

Texture--Loam or clay loam; with less than 45 percent sand.

C horizon:

Hue--10YR, 2.5Y or 5Y generally reflecting hue of parent material.

Chroma--3 or 4.

Texture--Gravelly sandy clay loam, gravelly clay loam, or gravelly loam.

Rock fragments--15 to 30 percent mainly pebbles.

Ekim Series

The Ekim series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from limestone and dolomite. The Ekim soils are on mountains and hills. Slopes are 15 to 75 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 41 degrees F.

Taxonomic class: Loamy-skeletal, carbonatic, frigid Aridic Calcixerolls

Typical pedon: Ekim very gravelly loam, 30 to 50 percent slopes, is located in an area of map unit 530. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 50 percent pebbles.

A1--0 to 2 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; strong fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine interstitial pores; 40 percent pebbles; strongly effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.

A2--2 to 9 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; many very fine and fine roots; few very fine tubular and many very fine interstitial pores; common faint silt films on faces of peds and lining pores; less than 1 millimeter thick lime coats on undersides of pebbles; 35 percent pebbles; strongly effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

Bk1--9 to 19 inches; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; many very fine, fine, few medium, and coarse roots; common very fine tubular and few very fine interstitial pores; common faint silt films on faces of peds and lining pores; 1 to 2 millimeter thick lime coats and pendants on underside of pebbles; 45 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

Bk2--19 to 25 inches; very pale brown (10YR 7/3) very gravelly loam, brown (10YR 5/3) moist; weak fine subangular blocky structure; hard, friable, moderately sticky and moderately plastic; common very fine roots; common very fine interstitial and few very fine tubular pores; 1 to 2 millimeters thick lime coats and pendants on pebbles; 35 percent pebbles; violently effervescent; strongly alkaline (pH 8.6); clear wavy boundary.

2R--25 to 33 inches; fractured limestone with 1 to 2 millimeter lime pendants on underside of fractured material.

Type location: Elko County, Nevada; approximately 14 miles north of Wells, about 600 feet west and 900 feet south of the northeast corner of section 04 T. 39 N., R. 62 E.; (41 degrees, 17 minutes, 55 seconds north latitude and 114 degrees, 57 minutes, 20 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry from July through October for 45 to 70 consecutive days.

Soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 7 to 12 inches.

Depth to calcic horizon: 7 to 12 inches.

Depth to bedrock: 20 to 40 inches.

Control section:

Clay content--20 to 30 percent.

Rock fragments--35 to 50 percent, mainly pebbles.

Calcium carbonate equivalent--40 to 60 percent for the less than 20 millimeters fraction.

Reaction--Moderately alkaline or strongly alkaline, increasing with depth.

A horizons:

Value--4 or 5 dry.

Chroma--2 or 3.

Bk horizons:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Texture--Very gravelly loam or very gravelly clay loam.

Clay content--20 to 30 percent.

Structure--Subangular blocky or it is massive.

Reaction--Moderately alkaline or strongly alkaline.

Elhina Series

The Elhina series consists of moderately deep to a duripan, well drained soils that formed in alluvium derived from volcanic rocks. Elhina soils are on fan remnants. Slopes are 2 to 8 percent. The mean annual precipitation is about 10 inches, and the mean annual temperature is about 44 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid Abruptic Xerollic Durargids

Typical pedon: Elhina gravelly loam, 2 to 8 percent slopes, is located in an area of map unit 380. (Colors are for dry soil unless otherwise noted.) The surface is partially covered with 45 percent pebbles and 5 percent cobbles.

A--0 to 2 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2); moist, moderate thick platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots, many very fine and fine vesicular pores; 15 percent pebbles; neutral (pH 7.0); abrupt smooth boundary.

E--2 to 5 inches; light brownish gray (10YR 6/2) clay loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure, slightly hard, friable, very sticky and very plastic; common very fine and fine roots; common very fine and fine tubular pores; 5 percent pebbles; neutral (pH 7.2); abrupt smooth boundary.

Bt1--5 to 10 inches; brown (10YR 5/3) clay, brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, firm, very sticky and very plastic; common very fine and fine roots; common very fine and fine tubular pores; many moderately thick clay films on faces of peds and lining pores; 5 percent pebbles; neutral (pH 7.3); clear smooth boundary.

Bt2--10 to 13 inches; brown (10YR 5/3) clay, brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, firm, very sticky and very plastic; common very fine and fine roots; common very fine and fine tubular pores; many moderately thick clay films on faces of peds and lining pores; 5 percent pebbles; neutral (pH 7.3); clear smooth boundary.

2Bk--13 to 22 inches; pale brown (10YR 6/3) extremely gravelly loam, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; few very fine and fine roots, common very fine tubular pores; 60 percent pebbles; lime is disseminated; violently effervescent, moderately alkaline (pH 8.2); abrupt smooth boundary.

2Bqkm--22 to 27 inches; white (10YR 8/1) indurated duripan, very pale brown (10YR 7/3) moist; continuous thin silica laminar cap; 60 percent pebbles; violently effervescent; abrupt wavy boundary.

2Bqk1--27 to 47 inches; pale brown (10YR 6/3) extremely gravelly sand, yellowish brown (10YR 5/4) moist, massive; slightly hard, firm, nonsticky and nonplastic; few very fine tubular pores; weak discontinuous cementation; 75 percent pebbles, 10 percent cobbles; violently effervescent, moderately alkaline (pH 8.2); abrupt smooth boundary.

3Bqk2--47 to 60 inches; very pale brown (10YR 7/3) sandy loam, yellowish brown (10YR 5/4) moist; massive, hard, firm, slightly sticky and slightly plastic; many very fine tubular pores; weak discontinuous cementation; 5 percent pebbles; violently effervescent, moderately alkaline (pH 8.2)

Type location: Elko County, Nevada; approximately 13 miles north of Contact; about 1,000 feet south and 2,000 feet west of the northeast corner of section 14, T. 47 N., R. 63 E.; (41 degrees, 58 minutes, 03 seconds north latitude and 114 degrees, 48 minutes, 10 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; dry from about mid July through mid October.

Soil temperature: 45 to 47 degrees F.

Depth to indurated duripan: 20 to 40 inches.

Control section:

Clay content--36 to 50 percent.

Rock fragments--5 to 15 percent pebbles.

A horizon:

Value--2 or 3 moist.

Chroma--2 or 3.

E horizon:

Chroma--2 or 3.

Texture--Clay loam, gravelly clay loam, gravelly loam.

Clay content--20 to 30 percent.

Rock fragments--5 to 20 percent pebbles.

Bt horizons:

Value--5 or 6 dry, 3 through 5 moist.

Chroma--2 through 4.

Structure--Angular blocky or subangular blocky.

Texture--Clay loam, gravelly clay loam, clay or gravelly clay.

Elocin Series

The Elocin series consists of very deep, moderately well drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. Elocin soils are on fan remnants. Slopes 2 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, frigid Aridic Palexerolls

Typical pedon: Elocin gravelly silt loam, occasionally flooded, 4 to 15 percent slopes, is located in an area of map unit 1140. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles.

A1--0 to 3 inches; grayish brown (10YR 5/2) gravelly silt loam, very dark grayish brown (10YR 3/2) moist; strong thick platy structure parting to moderate thin platy; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine interstitial pores; 20 percent pebbles; neutral (pH 7.2); abrupt smooth boundary.

A2--3 to 6 inches; grayish brown (10YR 5/2) gravelly silt loam, very dark grayish brown (10YR 3/2) moist; strong thin platy structure; soft, very friable, slightly sticky and slightly plastic; common very fine through medium roots; many very fine interstitial pores; 15 percent pebbles; neutral (pH 7.2); abrupt smooth boundary.

A3--6 to 10 inches; brown (10YR 5/3) silty clay loam, dark brown (10YR 3/3) moist; moderate thin platy structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, and few medium roots; many very fine interstitial pores; 10 percent pebbles; neutral (pH 7.2); abrupt wavy boundary.

2Bty1--10 to 14 inches; brown (10YR 5/3) very gravelly clay, brown (10YR 4/3) moist; moderate medium prismatic structure parting to strong fine angular blocky; hard, friable, very sticky and very plastic; common very fine and fine exped roots; common very fine tubular pores; many thin clay films on faces of peds and lining pores; few fine irregular gypsum masses; 45 percent pebbles and 5 percent

cobbles; neutral (pH 7.2); clear smooth boundary.

2Bty2--14 to 25 inches; light yellowish brown (10YR 6/4) very gravelly clay, dark yellowish brown (10YR 4/4) moist; few fine prominent yellowish red (5YR 5/6) moist mottles; moderate medium prismatic structure; very hard, firm, very sticky and very plastic; few very fine and fine exped roots; few very fine tubular pores; continuous stress surfaces; few fine irregular gypsum masses; 50 percent pebbles and 5 percent cobbles; slightly alkaline (pH 7.4); clear smooth boundary.

3Btk--25 to 36 inches; light yellowish brown (10YR 6/4) gravelly clay, dark yellowish brown (10YR 4/4) moist; strong medium prismatic structure; extremely hard, extremely firm, very sticky and very plastic; few very fine exped roots; common very fine tubular pores; continuous stress surfaces; common medium soft lime masses; 15 percent pebbles; slightly alkaline (pH 7.6); clear smooth boundary.

3Cqk--36 to 60 inches; very pale brown (10YR 7/3) loam, brown (10YR 5/3) moist; few fine prominent reddish brown (5YR 5/4) moist mottles; common fine prominent very dark gray (5YR 3/1) manganese stains, moist; strong medium platy structure; very hard, firm and brittle, nonsticky and nonplastic; few very fine interstitial pores; 10 percent pebbles; many fine soft horizontal lime seams; continuous brittle matrix; violently effervescent; moderately alkaline (pH 8.2).

Type location: Elko County, Nevada; approximately 12 miles northeast of Wells; about 800 feet east and 500 feet north of the southwest corner of section 23 T. 39 N., R. 63 E.; (41 degrees, 14 minutes, 40 seconds north latitude and 114 degrees, 49 minutes, 35 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from late June through October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 10 to 15 inches, in some pedons, it may include the upper Bt subhorizon.

Depth to continuous brittle matrix and base of Bt horizon: 25 to 39 inches.

Depth to secondary carbonates: 20 to 30 inches.

Control section:

Clay content--Averages 50 to 60 percent.
 Rock fragments--Averages 35 to 60 percent pebbles with up to 10 percent cobbles.
 Other features--There is an abrupt textural boundary between the A and the Bt horizons.

A horizons:

Chroma--2 or 3.

Bt horizons:

Hue--7.5YR or 10YR.
 Value--5 or 6 dry, 3 or 4 moist.
 Chroma--3 through 6.
 Texture--Very gravelly clay or very cobbly clay in the upper subhorizons and very gravelly clay or gravelly clay in the lower subhorizon.
 Clay content--50 to 60 percent.
 Rock fragments--Averages 35 to 60 percent, mainly pebbles with up to 30 percent cobbles common in some subhorizons.
 Structure--Moderate or strong, prismatic or angular blocky.
 Consistence--Hard to extremely hard dry.
 Reaction--Neutral or slightly alkaline.

Cqk horizons:

Value--6 or 7 dry, 4 or 5 moist.
 Chroma--2 through 4.
 Texture--Loam, gravelly loam or gravelly sandy loam.
 Clay content--10 to 20 percent.
 Rock fragments--5 to 30 percent, mainly pebbles.
 Structure--Moderate or strong platy or it is massive.
 Consistence--Very hard or extremely hard, dry; firm and brittle, moist.

Enko Series

The Enko series consists of very deep, well drained soils that formed in loamy alluvium derived from mixed rocks, loess, and volcanic ash. Enko soils are on fan remnants, inset fans, and fan skirts. Slopes are 0 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Coarse-loamy, mixed, mesic Durixerollic Camborthids

Typical pedon: Enko fine sandy loam, 4 to 15 percent slopes, is located in an area of map unit 171. (Colors are for dry soil unless otherwise noted.)

A--0 to 3 inches; pale brown (10YR 6/3) fine sandy loam, dark brown (10YR 3/3) moist; weak thin platy structure; soft, very friable, nonsticky and nonplastic; many very fine and common fine roots; few very fine interstitial pores; slightly alkaline (pH 7.6); clear smooth boundary.

Bw--3 to 15 inches; pale brown (10YR 6/3) fine sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and few medium roots; few very fine interstitial pores; slightly effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Bqk1--15 to 26 inches; light gray (2.5Y 7/2) fine sandy loam, brown (10YR 5/3) moist; massive; hard, firm and brittle, nonsticky and nonplastic; many very fine roots; few very fine interstitial pores; 40 percent very hard, very firm, 10 to 20 millimeter diameter durinodes; continuous brittle matrix; strongly effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Bqk2--26 to 34 inches; white (2.5Y 8/2) fine sandy loam, light brownish gray (2.5Y 6/2) moist; massive; hard, firm and brittle, nonsticky and nonplastic; few very fine roots; few very fine interstitial pores; 40 percent very hard, very firm, 10 to 20 millimeters durinodes; continuous brittle matrix; violently effervescent; moderately alkaline (pH 8.4); gradual wavy boundary.

Bqk3--34 to 51 inches; white (2.5Y 8/2) fine sandy loam, light gray (5Y 7/2) moist; moderate thin platy structure; hard, firm, nonsticky and nonplastic; few fine roots; many very fine interstitial pores; 60 percent discontinuous weak silica and lime cementation; violently effervescent; moderately alkaline (pH 8.4); gradual smooth boundary.

Bqk4--51 to 62 inches; white (10YR 8/1) fine sandy loam, light gray (2.5Y 7/2) moist; massive; very hard, firm and brittle, nonsticky and nonplastic; many very fine interstitial and common fine tubular pores; 50 percent very hard, very firm, 2 to 10 millimeters durinodes; continuous brittle matrix; violently effervescent; lime segregated in many fine filaments; very strongly alkaline (pH 9.0).

Type location: Elko County, Nevada; approximately 8 miles northwest of Wells near Bishop Flats; about 1,000 feet south and 700 feet west of the northeast corner of section 18, T. 38 N., R. 62 E.; (41 degrees, 10 minutes, 57 seconds north latitude and 115 degrees, 00 minutes, 23 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring, dry June through October.

Soil temperature: 49 to 52 degrees F.

Thickness of A and Bw horizons: 12 to 30 inches.

Depth to continuous brittle matrix: 12 to 32 inches.

Control section:

Other features--Below 40 inches some pedons have sandy or gravelly substrata, or substrata containing gypsum crystals. Some pedons have noneffervescent Bq horizons above the Bqk horizon.

Clay content--10 to 18 percent.

Rock fragments--0 to 15 percent pebbles.

A horizon:

Hue--10YR or 2.5Y.

Value--Commonly 6 or 7 dry, with 5 dry in some subhorizons of some pedons, 3 or 4 moist.

Chroma--2 through 4.

Reaction--Neutral through moderately alkaline.

Bw horizon:

Value--5 through 7 dry, 3 through 5 moist.

Chroma--2 through 4.

Texture--Loam, fine sandy loam, or sandy loam; some pedons have strata of silt loam or clay loam in the upper part where stratified.

Structure--Prismatic, angular blocky, subangular blocky or it is massive.

Consistence--Nonsticky, slightly sticky or sticky, nonplastic, slightly plastic or plastic, wet.

Reaction--Neutral through moderately alkaline, increasing with depth.

Carbonates--Some pedons are calcareous in the lower portion of the horizon.

Bqk horizon:

Hue--10YR, 2.5Y, 5Y.

Value--4 through 7 moist.

Chroma--1 through 4 dry, 2 through 4 moist.

Texture--Loam, sandy loam, fine sandy loam.

Silica cementation--Continuous brittle matrix in horizons 10 to 40 inches thick. Subhorizons not continuously brittle contain 20 to 50 percent durinodes or are 20 to 75 percent discontinuous weakly silica-cemented.

Reaction--Slightly alkaline through very strongly alkaline, commonly increasing with depth.

Other features--Relict iron mottles are common in many pedons. Very gravelly or extremely gravelly substratum phases are common below depths of 40 inches in some pedons.

Fenelon Series

The Fenelon series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from mixed rocks, loess, and volcanic ash. The Fenelon soils are on hills and pediments. Slopes are 4 to 30 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Fine-loamy, mixed, frigid Aridic Calcic Argixerolls

Typical pedon: Fenelon gravelly silt loam, 4 to 15 percent slopes, is located in an area of map unit 656. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 20 percent pebbles.

A1--0 to 3 inches; dark grayish brown (10YR 4/2) gravelly silt loam, very dark brown (10YR 2/2) moist; weak fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine interstitial pores; 15 percent pebbles; slightly effervescent; slightly alkaline (pH 7.6); clear wavy boundary.

A2--3 to 6 inches; dark grayish brown (10YR 4/2) gravelly silt loam, very dark brown (10YR 2/2) moist; weak thin platy structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; many very fine interstitial and few fine tubular pores; 20 percent pebbles; strongly effervescent; slightly alkaline (pH 7.8); clear wavy boundary.

Btk1--6 to 11 inches; brown (10YR 5/3) gravelly silty clay loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; hard, firm, moderately sticky and moderately plastic; common very fine roots; many very fine interstitial and few fine tubular

pores; common thin clay films on faces of peds and lining pores; thin lime coats on undersides of rock fragments; 20 percent pebbles; strongly effervescent; moderately alkaline (pH 8.0); clear wavy boundary.

Btk2--11 to 15 inches; brown (10YR 5/3) gravelly silty clay loam, dark brown (10YR 3/3) moist; weak fine angular blocky structure; very hard, firm, moderately sticky and moderately plastic; common very fine and few fine roots; common very fine interstitial and few fine tubular pores; common thin clay films on faces of peds and lining pores; few thin lime filaments, and thin lime coats on undersides of rock fragments; 15 percent pebbles; strongly effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

Btk3--15 to 23 inches; light brownish gray (10YR 6/2) gravelly silty clay loam, dark grayish brown (10YR 4/2) moist; weak moderate subangular blocky structure; hard, friable, moderately sticky and moderately plastic; common very fine and few fine roots; many very fine interstitial pores; moderately thick clay films on faces of peds and lining pores; thin lime coats on undersides of rock fragments; 20 percent pebbles; violently effervescent; moderately alkaline (pH 8.3); clear wavy boundary.

Btk4--23 to 37 inches; light gray (10YR 7/2) gravelly silty clay loam, brown (10YR 5/3) moist; massive; hard, friable, moderately sticky and moderately plastic; many very fine, few fine, and medium roots; many very fine interstitial, few very fine and fine tubular pores; few moderately thick clay films on faces of peds and lining pores; common fine irregularly shaped lime seams and thin lime coats on undersides of rock fragments; 25 percent pebbles; 40 percent rock structure; violently effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

Cr--37 to 50 inches; light gray (2.5YR 7/2) soft siltstone, grayish brown (2.5YR 5/2) moist.

Type location: Elko County, Nevada; approximately 18 miles northeast of Wells in the Windermere Hills; about 2,375 feet west and 600 feet south of the northeast corner of section 12, T. 39 N., R. 64 E.; (41 degrees, 17 minutes, 02 seconds north latitude and 114 degrees, 41 minutes, 02 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from mid June through October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 10 to 16 inches thick, includes the upper part of the argillic horizon.

Depth to paralithic contact: 20 to 40 inches.

Control section:

Clay content--27 to 35 percent.

Rock fragments--15 to 35 percent, mainly pebbles.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Upper Btk horizons:

Hue--7.5YR or 10YR.

Texture--Gravelly silty clay loam or gravelly clay loam.

Structure--Weak or moderate, subangular blocky or angular blocky.

Lower Btk horizons:

Hue--7.5YR or 10YR.

Value--5 through 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Texture--Gravelly silty clay loam or gravelly clay loam.

Structure--Weak or moderate subangular blocky or it is massive. Rock structure is common in most subhorizons above the paralithic contact.

Fez Series

The Fez series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from tuff. The Fez soils are on hills. Slopes are 15 to 30 percent. The mean annual precipitation is about 18 inches and the mean annual temperature is about 41 degrees F.

Taxonomic class: Ashy, frigid Mollic Vitrandepts

Typical pedon: Fez loamy sand, 15 to 50 percent slopes, is located in an area of map unit 417. (Colors are for dry soil unless otherwise noted.)

- A1--0 to 1 inch; dark grayish brown (10YR 4/2) loamy sand, very dark brown (10YR 2/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and few medium roots; few very fine tubular pores; 5 percent pebbles; neutral (pH 6.8); clear smooth boundary.
- A2--1 to 4 inches; brown (10YR 4/3) loamy sand, very dark brown (10YR 2/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and few medium roots; few very fine tubular pores; 5 percent pebbles; neutral (pH 7.0); clear smooth boundary.
- A3--4 to 14 inches; grayish brown (10YR 5/2) loamy sand, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; common very fine, fine, and few medium roots; common very fine tubular pores; 5 percent pebbles; neutral (pH 7.0); clear smooth boundary.
- AC--14 to 23 inches; pale brown (10YR 6/3) loamy sand, dark brown (10YR 3/3) moist; common fine faint light yellowish brown (10YR 6/4) mottles; moderate fine subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; common very fine, fine, and few medium roots; common very fine tubular pores; 10 percent tuff pebbles; 10 percent fine and medium subangular blocky rock structure; neutral (pH 7.0); gradual smooth boundary.
- Cr--23 inches; pale yellow (2.5Y 8/4) soft, consolidated vitric tuff.

Type location: Elko County, Nevada; approximately 15 miles east of Contact; about 990 feet east and 2,640 feet north of the southwest corner of section 23, T. 45 N., R. 66 E.; (41 degrees, 46 minutes, 23 seconds north latitude and 114 degrees, 28 minutes, 08 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, moist in winter through early summer, dry mid-July to October.
Soil temperature: 42 to 47 degrees F.
Volcanic ash and glass aggregates: 60 to 80 percent.
Mollic epipedon thickness: 10 to 20 inches.
Depth to paralithic contact: 20 to 40 inches.
Control section:
 Percent clay--1 to 15 percent clay.

Texture--Loamy sand and loamy fine sand.
 Rock fragments--Up to 15 percent, dominantly tuff pebbles.
 Reaction--Neutral or slightly alkaline.
 Effervescence--Noneffervescent, although some pedons are slightly effervescent.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.
 Chroma--2 or 3.

AC horizon:

Value--3 or 4 moist.
 Chroma--3 or 4.
 Structure--Fine or medium subangular blocky.
 Other features--Mottles are absent in some pedons.

Forvic Series

The Forvic series consists of moderately deep, well drained soils that formed in alluvium derived from welded tuff. Forvic soils are on fan remnants and pediments. Slopes are 4 to 15 percent. The mean annual precipitation is about 15 inches and the annual temperature is about 42 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid Typic Durixerolls

Typical pedon: Forvic gravelly silty clay loam, 4 to 15 percent slopes, is located in an area of map unit 190. (Colors are for dry color unless otherwise noted.)

- A1--0 to 5 inches; dark grayish brown (10YR 4/2) gravelly silty clay loam, black (10YR 2/1) moist; weak medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine interstitial and tubular pores; 25 percent pebbles; neutral (pH 7.0); clear smooth boundary.
- A2--5 to 13 inches; dark grayish brown (10YR 4/2) gravelly silty clay loam, black (10YR 2/1) moist; weak medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; common very fine, fine and medium roots; common very fine tubular pores; 20 percent pebbles; neutral (pH 7.0); clear smooth boundary.

Bt1--13 to 20 inches; brown (10YR 5/3) gravelly clay, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; very hard, firm, very sticky and very plastic; few very fine, fine and medium roots; few very fine tubular pores; few moderately thick clay films on faces of peds; 20 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt2--20 to 22 inches; variegated light yellowish brown (10YR 6/4) and brown (10YR 5/3) very gravelly clay, yellowish brown (10YR 5/4) and brown (10YR 4/3) moist; moderate coarse subangular blocky structure; very hard, firm, very sticky and very plastic; few very fine, fine and medium roots; common very fine and fine tubular pores; common moderately thick clay films lining pores and on faces of peds; 40 percent pebbles; neutral (pH 7.2) abrupt smooth boundary.

Bqm--22 to 30 inches; indurated duripan; 1 to 2 millimeter thick continuous silica laminae.

2Cr--30 inches; welded ash-flow tuff.

Type location: Elko County, Nevada; approximately 17 miles east of Jackpot; about 800 feet north and 1,600 feet east of the southwest corner of section 2, T. 47 N., R. 67 E.; (41 degrees, 59 minutes, 23 seconds north latitude and 114 degrees, 20 minutes, 17 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; dry from about mid-July through mid-October.

Soil temperature: 43 to 45 degrees F.

Mollic epipedon thickness: 20 to 30 inches, including the upper part of Bt horizon

Depth to duripan and thickness of A and Bt horizons: 20 to 40 inches

Depth to paralithic contact: 24 to 40 inches.

Control section:

Clay content--50 to 59 percent.

Rock fragments--5 to 30 percent pebbles.

A horizons:

Value--3 or 4 dry.

Chroma--1 or 2 dry or moist.

Bt horizons:

Hue--7.5YR or 10YR.

Value--2 through 6 dry, 2 through 4 moist.

Chroma--2 through 4.

Texture--Clay, gravelly clay and thin layers of very gravelly clay.

Structure--Subangular blocky, angular blocky, or prismatic.

Gance Series

The Gance series consists of very deep, well drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. Gance soils are on fan remnants. Slopes are 2 to 50 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, mesic Durixerollic Haplargids

Typical pedon: Gance very gravelly loam, 15 to 30 percent slopes, is located in an area of map unit 131. (Colors are for dry soils unless otherwise noted.) The soil surface is partially covered with 40 percent pebbles.

A--0 to 5 inches; pale brown (10YR 6/3) very gravelly loam, dark brown (10YR 3/3) moist; strong fine granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine, fine, common medium, and coarse roots; many very fine interstitial pores; 35 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt--5 to 13 inches; yellowish brown (10YR 5/4) very gravelly clay, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; hard, friable, very sticky and very plastic; many very fine, fine, common medium, and coarse roots; many very fine tubular pores; 40 percent pebbles; many moderately thick clay films on faces of peds and lining pores; slightly alkaline (pH 7.4); clear wavy boundary.

Btk--13 to 20 inches; light yellowish brown (10YR 6/4) very gravelly clay, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; hard, friable, very sticky and very plastic; common very fine, few fine, and medium roots; many very fine tubular pores; few thin clay films lining pores; 1 millimeter thick lime and silica coats on the underside of rock fragments; 45 percent pebbles and 10 percent cobbles; slightly effervescent;

moderately alkaline (pH 8.2); clear wavy boundary.

Bqk1--20 to 30 inches; light yellowish brown (10YR 6/4) very gravelly sandy loam, yellowish brown (10YR 5/4) moist; massive; hard, friable, slightly sticky and slightly plastic; common very fine and few fine roots; many very fine and fine interstitial, and common very fine tubular pores; 1 millimeter thick lime and silica coats on rock fragments; 45 percent pebbles, 10 percent cobbles; strongly effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

Bqk2--30 to 60 inches; very pale brown (10YR 7/4) extremely gravelly loam, light yellowish brown (10YR 6/4) moist; massive; hard, firm and brittle, slightly sticky and slightly plastic; few very fine and fine roots; many very fine and fine interstitial and common very fine tubular pores; 1 millimeter thick lime and silica coats on rock fragments; few large rounded soft lime masses, and few irregular lime filaments; 45 percent pebbles, 10 percent cobbles and 5 percent stones; continuous brittle matrix; strongly effervescent; moderately alkaline (pH 8.2).

Type location: Elko County, Nevada; about 28 miles north of Wells, about 500 feet west and approximately 1,800 feet south of the northeast corner of section 36, T. 42 N., R. 62 E.; (41 degrees, 29 minutes, 20 seconds north latitude and 114 degrees, 53 minutes, 51 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in some part late October through early June.

Soil temperature: 47 to 52 degrees F.

Depth to base of Bt horizon: 20 to 32 inches.

Depth to carbonates: 13 to 32 inches.

Depth to continuously brittle Bqk horizon: 25 to 38 inches.

Control section:

Clay content--Averages 35 to 55 percent.

Other features--Some pedons have noncemented horizons below the Bqk horizon. Some pedons have buried Bt horizons below 56 inches.

Rock fragments--Averages 35 to 75 percent.

A horizon:

Value--5 or 6 dry, 3 through 5 moist.
Chroma--2 or 3.

Reaction--Neutral to moderately alkaline.

Bt horizon:

Value--4 through 6 dry, 3 through 5 moist.

Chroma--3 or 4.

Texture--Very gravelly clay, extremely gravelly clay or very gravelly sandy clay.

Clay content--40 to 55 percent.

Rock fragments--35 to 75, percent mainly pebbles with up to 20 percent cobbles.

Structure--Fine or medium subangular or angular blocky or fine to coarse prismatic.

Reaction--Slightly alkaline or moderately alkaline, usually increasing with depth.

Bqk horizon:

Value--6 through 8 dry, 5 through 7 moist.

Chroma--2 through 4.

Texture--Very gravelly, extremely gravelly or very cobbly sandy loam or loam.

Rock fragments--35 to 80 percent, of which up to 40 percent is cobbles.

Cementation--Continuously brittle matrix that is hard and firm. Thin subhorizons lack a continuous brittle matrix.

Reaction--Moderately alkaline or strongly alkaline.

Effervescence--Strongly effervescent or violently effervescent.

Geysen Series

The Geysen series consists of very deep, well drained soils that formed in loess and volcanic ash over alluvium derived from mixed rocks. Geysen soils are on fan remnants. Slopes are 2 to 4 percent. The mean annual precipitation is about 8 inches and the mean annual temperature is about 49 degrees F.

Taxonomic class: Fine-loamy, mixed, mesic Durixerollic Natrargids

Typical pedon: Geysen silt loam, 2 to 4 percent slopes, is located in an area of the map unit 730. (Colors are for dry soils unless otherwise noted.) The soil surface is partially covered with 10 percent pebbles.

A--0 to 4 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; moderate medium and thick platy structure; slightly hard, very friable,

slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine vesicular pores; 5 percent pebbles; strongly effervescent; very strongly alkaline (pH 9.2); clear smooth boundary.

Btnk--4 to 6 inches; pale brown (10YR 6/3) clay loam, brown (10YR 4/3) moist; weak fine and medium prismatic structure; hard, friable, very sticky and moderately plastic; many very fine, fine, and few medium roots; many very fine tubular pores; many moderately thick clay films on faces of peds and lining pores; 5 percent pebbles; strongly effervescent; very strongly alkaline (pH 9.4); clear smooth boundary.

Btnk2--6 to 12 inches; very pale brown (10YR 7/3) clay loam, yellowish brown (10YR 5/4) moist; moderate fine and medium prismatic structure; hard, friable, moderately sticky and moderately plastic; many very fine, fine, and few medium roots; many very fine tubular pores; 10 percent hard 1/4 to 1/2 inch durinodes; many moderately thick clay films on faces of peds and lining pores; many thin lime coats on undersides of pebbles; many fine lime masses and filaments, and few medium and large lime masses; 5 percent pebbles; violently effervescent; very strongly alkaline (pH 9.6); clear smooth boundary.

Bqk1--12 to 22 inches thick; very pale brown (10YR 7/3) loam, dark yellowish brown (10YR 4/4) moist; moderate fine and medium prismatic structure; hard, firm and brittle, slightly sticky and slightly plastic; many very fine and few fine roots; many very fine and fine tubular pores; 25 percent hard 1/4 to 1/2 inch durinodes; 5 percent pebbles; common medium and large lime masses; continuous brittle matrix; violently effervescent; very strongly alkaline (pH 9.6); gradual smooth boundary.

Bqk2--22 to 36 inches; very pale brown (10YR 8/3) fine sandy loam, yellowish brown (10YR 5/4) moist; few distinct yellowish brown (10YR 5/4) relict mottles; massive; slightly hard, friable, slightly sticky and slightly plastic; many very fine and common very fine roots; many fine tubular pores; 25 percent hard 1/4 to 1/2 inch durinodes; many thin lime coats on undersides of pebbles; many medium and large lime masses; 10 percent pebbles; violently effervescent; 50 percent brittle matrix; very strongly alkaline (pH 9.6); abrupt smooth boundary.

Bk--36 to 43 inches; very pale brown (10YR 7/4) fine sandy loam, dark yellowish brown (10YR

4/4) moist; single grain; loose, nonsticky and nonplastic; many very fine and fine roots; many fine interstitial pores; many moderately thick lime pendants on undersides of pebbles; many fine lime masses and filaments; 10 percent pebbles; violently effervescent; strongly alkaline (pH 8.6); abrupt smooth boundary.

B'qk--43 to 60 inches; light yellowish brown (10YR 6/4) fine sandy loam, dark yellowish brown (10YR 4/4) moist; few fine faint yellowish brown (10YR 5/4) relict mottles; massive; slightly hard, friable, slightly sticky and slightly plastic; many very fine, fine, and few medium roots; many very fine and fine tubular pores; 30 percent hard 1/4 to 1/2 inch durinodes; few fine gypsum filaments; many thin lime coats on undersides of pebbles; many fine and medium lime filaments; 10 percent pebbles; violently effervescent; 50 percent brittle matrix; moderately alkaline (pH 8.4).

Type location: Elko County, Nevada; approximately 28 miles south of Jackpot; about 1,500 feet north and 2,900 feet west of the southeast corner of section 17, T. 43 N., R. 63 E.; (41 degrees, 36 minutes, 45 seconds north latitude and 114 degrees, 52 minutes, 07 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the winter and spring but dry from mid-June through October.

Soil temperature: 48 to 52 degrees F.

Depth to continuous brittle matrix: 11 to 20 inches.

Control section:

Clay content--Averages 25 to 35 percent.

Reaction--Moderately alkaline to very strongly alkaline.

SAR--13 to 45.

Rock fragments--5 to 15 percent, mainly pebbles.

A horizon:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Btnk horizon:

Value--5 through 7 dry, 4 or 5 moist.

Chroma--2 through 4.

Texture--Clay loam, silty clay loam, or loam.

Structure--Weak or moderate prismatic.

Bqk horizon:

Value--6 through 8 dry, 4 or 5 moist.
 Chroma--2 or 3.
 Texture--Loam fine sandy loam or very fine sandy loam.
 Rock fragments--5 to 15 percent, mainly pebbles.
 Cementation--Some subhorizon within 40 inches is continuously brittle, Bqk subhorizons that lack continuous cementation, may contain up to 50 percent discontinuous weak silica cementation or durinodes in a friable or very friable matrix.
 Lime segregations--Few to many, fine to coarse.
 Other features--Some pedons have relict mottles below 20 inches. Few gypsum filaments are in some pedons.

Gochea Series

The Gochea series consists of very deep, well drained soils that formed in alluvium derived from mixed rocks, loess and volcanic ash. The Gochea soils are on fan remnants, stream terraces and hills. Slopes are 2 to 15 percent. The mean annual precipitation is about 12 inches, and the mean annual temperature is about 44 degrees F.

Taxonomic class: Fine-loamy, mixed, frigid Durargidic Argixerolls

Typical pedon: Gochea loam, 2 to 8 percent slopes, is located in an area of map unit 291. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 25 percent pebbles.

A1--0 to 3 inches; grayish brown (10YR 5/2) loam, dark brown (10YR 3/3) moist; strong very thin platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine roots; common very fine interstitial pores; 10 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

A2--3 to 11 inches; brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine, few fine, and medium roots; common very fine tubular pores; 5 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

Bt1--11 to 20 inches; light yellowish brown (10YR 6/4) clay loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; few very fine and fine roots; many very fine tubular pores; common thin clay films on faces of peds and lining pores; 10 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

Bt2--20 to 25 inches; light yellowish brown (10YR 6/4) clay loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; few very fine roots; common very fine tubular pores; common thin clay films on faces of peds and lining pores; 10 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

Bq--25 to 53 inches; light yellowish brown (10YR 6/4) gravelly loam, brown (10YR 4/3) moist; massive; hard, firm, sticky and slightly plastic; few fine roots; many very fine tubular pores; 5 to 10 millimeters, hard, firm durinodes; common thin clay films on faces of peds and lining pores; 50 percent discontinuous weak silica cementation and 20 percent, 30 percent pebbles; slightly alkaline (pH 7.4); abrupt wavy boundary.

2Ck--53 to 75 inches; light yellowish brown (10YR 6/4) extremely gravelly sand, brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; 65 percent pebbles; many lime coats on pebbles; slightly effervescent; slightly alkaline (pH 7.8).

Type location: Elko County, Nevada; approximately 12 miles north of Wells; about 1,900 feet east of the northwest corner of section 20, T. 39 N., R. 62 E.; (41 degrees, 15 minutes, 33 seconds north latitude and 114 degrees, 59 minutes, 38 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist winter and spring, dry mid June through October.

Soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 10 to 15 inches which commonly includes the upper part of the argillic horizon.

Depth to Bq horizon: 18 to 25 inches.

Depth to bedrock: Greater than 60 inches except

in bedrock substratum phases where the depth to bedrock is 40 to 60 inches.

Control section:

Clay content--25 to 35 percent.
Rock fragments--5 to 35 percent, mainly pebbles.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.
Chroma--2 or 3.
Reaction--Neutral or slightly alkaline.

Bt horizons:

Value--5 or 6 dry, 3 or 4 moist.
Chroma--2 through 4.
Texture--Gravelly clay loam, gravelly sandy clay loam, clay loam.
Clay content--25 to 35 percent.
Rock fragments--5 to 35 percent, mainly pebbles.
Structure--Subangular blocky or angular blocky.

Bq horizons:

Value--5 through 7 dry, 3 through 5 moist.
Chroma--2 through 4.
Texture--Sandy loam or gravelly loam; cobbly loam or cobbly sandy loam in some pedons.
Rock fragments--0 to 30 percent.
Silica cementation--20 to 80 percent durinodes or has up to 50 percent weak discontinuous cementation.
Reaction--Slightly alkaline to strongly alkaline.

2Ck horizon:

Value--4 or 5 moist.
Texture--Very gravelly or extremely gravelly sand.
Clay content--2 to 8 percent.
Rock fragments--50 to 75 percent pebbles.
Other features--Soils with a bedrock substratum phase lack this horizon.

Gollaher Series

The Gollaher series consists of very shallow, well drained soils that formed in residuum and colluvium derived from limestone and dolomite. Gollaher soils are on mountains and hills. Slopes are 4 to 75 percent. The mean annual precipitation is about 14 inches, and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy-skeletal, carbonatic, frigid Lithic Xerorthents

Typical pedon: Gollaher very gravelly loam, 15 to 50 percent slopes, is located in an area of map unit 237. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 50 percent pebbles and 5 percent cobbles.

A--0 to 2 inches; light brownish gray (10YR 6/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak thick platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; common very fine tubular pores; 45 percent pebbles; thin continuous lime pendants on undersides of pebbles; violently effervescent; moderately alkaline (pH 8.2); clear smooth boundary.

Bk--2 to 6 inches; light brownish gray (10YR 6/2) very gravelly loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, few fine, and medium roots; common very fine tubular pores; 50 percent pebbles; continuous thick lime pendants on undersides of pebbles; violently effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.

R--6 inches; limestone.

Type location: Elko County, Nevada; about 11 miles southwest of Jackpot near Mahogany Basin; about 700 feet east and 1,500 feet south of the northwest corner of section 11, T. 46 N., R. 63 E.; (41 degrees, 53 minutes, 36 seconds north latitude and 114 degrees, 48 minutes, 35 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the winter and spring, dry from July through October. Moist in all parts for 45 or more days in the 4 months following the winter solstice.

Soil temperature: 43 to 47 degrees F.

Depth to bedrock: 4 to 10 inches.

Control section:

Clay content--15 to 27 percent.
Calcium carbonate equivalent--40 to 60 percent.

Rock fragments--45 to 75 percent, mainly pebbles with up to 5 percent cobbles.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Reaction--Slightly alkaline or moderately alkaline.

Other features--Common to continuous thin or medium lime pendants on undersides of rock fragments.

Bk horizon:

Value--3 or 4 moist.

Chroma--2 or 3.

Texture--Very gravelly loam or extremely gravelly loam.

Reaction--Slightly alkaline or moderately alkaline.

Other features--Common to continuous thin to thick lime pendants on undersides of rock fragments.

Golsum Series

The Golsum series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from tuffaceous rocks. The Golsum soils are on pediments. Slopes are 4 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, frigid Aridic Calcic Argixerolls

Typical pedon: Golsum very gravelly clay loam, 4 to 15 percent slopes, is located in an area of map unit 1064. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 50 percent pebbles.

A--0 to 3 inches; dark grayish brown (10YR 4/2) very gravelly clay loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; many very fine roots; many very fine interstitial pores; 40 percent pebbles, slightly alkaline (pH 7.4); clear smooth boundary.

Bt1--3 to 7 inches; dark grayish brown (10YR 4/2) gravelly clay, very dark grayish brown (10YR 3/2) moist; moderate fine and medium angular blocky structure; hard, firm, very sticky and very plastic; common very fine roots; common

very fine interstitial pores; common moderately thick clay films lining pores and on faces of peds; 20 percent pebbles; slightly alkaline (pH 7.5); clear wavy boundary.

Bt2--7 to 16 inches; brown (7.5YR 4/2) very gravelly clay, dark brown (7.5YR 3/2) moist; strong medium prismatic structure; very hard, very firm, very sticky and very plastic; common very fine roots; common very fine interstitial pores; many stress surfaces; thin lime coats on undersides of rock fragments; 30 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.6); clear wavy boundary.

Btk--16 to 26 inches; brown (7.5YR 5/2) very gravelly clay loam, dark grayish brown (10YR 4/2) moist; strong fine angular blocky structure; hard, firm, very sticky and very plastic; common very fine roots; common very fine interstitial pores many stress surfaces; thick lime coats on undersides of rock fragments; few fine lime filaments; 40 percent pebbles and 5 percent cobbles; strongly effervescent; moderately alkaline (pH 8.0); clear wavy boundary.

2Cr--26 to 32 inches; saprolitic tuff; few thin clay films coating fractures.

Type location: Elko County, Nevada; approximately 11 miles west of Montello; 1,500 feet east and 1,200 feet north of the southwest corner of section 27, T. 40 N., R. 67 E.; (41 degrees, 19 minutes, 15 seconds north latitude and 114 degrees, 23 minutes, 16 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; most in winter and spring, dry late June through October.

Soil temperature: 42 to 47 degrees F.

Mollic epipedon thickness: 10 to 16 inches thick, includes at least the upper Bt horizon.

Depth to secondary carbonates: 15 to 30 inches.

Depth to paralithic contact: 20 to 40 inches.

Control section:

Clay content--Averages 35 to 45 percent.

Rock fragments--Averages 35 to 55 percent, mainly pebbles with some cobbles.

A horizon:

Value--4 or 5 dry.

Chroma--2 or 3.

Bt horizons:

Hue--10YR or 7.5YR.
 Value--4 through 6 dry, 3 or 4 moist.
 Chroma--2 through 4.
 Texture--Very gravelly clay, very gravelly clay loam.
 Structure--Thin subhorizons are gravelly clay, subangular blocky, angular blocky, prismatic or it is massive.
 Reaction--Neutral or slightly alkaline.

Btk horizon:

Hue--10YR or 7.5YR.
 Value--5 or 6 dry.
 Chroma--2 through 4.
 Texture--Very gravelly loam or very gravelly clay loam.
 Structure--Weak to strong, subangular blocky or angular blocky.
 Reaction--Moderately alkaline or strongly alkaline.

Graley Series

The Graley series consists of shallow, well drained soils that formed in residuum and colluvium derived from mixed rocks. Graley soils are on mountains and hills. Slopes are 4 to 50 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, frigid Lithic Argixerolls

Typical pedon: Graley extremely gravelly loam, 4 to 15 percent slopes, is located in an area of map unit 224. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 70 percent pebbles.

A1--0 to 4 inches; grayish brown (10YR 5/2) extremely gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine granular structure; soft, very friable, sticky and plastic; many very fine and fine roots; many very fine interstitial pores; 65 percent pebbles; slightly alkaline (pH 7.4); abrupt smooth boundary.
 A2--4 to 9 inches; grayish brown (10YR 5/2) extremely gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard,

friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine interstitial and common very fine tubular pores; 60 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

Bt--9 to 15 inches; pale brown (10YR 6/3) very gravelly clay, dark brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, friable, very sticky and very plastic; many very fine, fine and few medium roots; many very fine tubular pores; common thick clay films on faces of peds and lining pores; 40 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

R--15 inches; fractured chert, few clay films extending into fractures.

Type location: Elko County, Nevada; approximately 1 mile north of HD Summit; about 250 feet east and 500 feet south of the northwest corner of section 13, T. 40 N., R. 63 E.; (41 degrees, 21 minutes, 26 seconds north latitude and 114 degrees, 48 minutes, 24 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; moist in winter and spring, dry mid-July through late October.

Soil temperature: 42 to 47 degrees F.

Mollic epipedon thickness: 7 to 12 inches, does not include the argillic horizon.

Depth to bedrock: 14 to 20 inches.

Control section:

Clay content--35 to 45 percent.

Rock fragments--35 to 60 percent, mainly pebbles.

Reaction--Neutral or slightly alkaline.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizon:

Hue--7.5YR or 10YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 through 4.

Texture--Very gravelly clay loam, or very gravelly clay.

Structure--Angular or subangular blocky.

Consistence--Very hard or hard, dry; friable to firm, moist; moderately sticky or very sticky; moderately plastic or very plastic wet.

Gravier Series

The Gravier series consists of very deep, well drained soils that formed in alluvium derived from mixed rocks. Gravier soils are on fan skirts, inset fans and fluvial areas on fan remnants. Slopes are 2 to 30 percent. The mean annual precipitation is about 6 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy-skeletal, mixed, mesic Typic Calciorthids

Typical pedon: Gravier gravelly loam, 2 to 8 percent slopes, is located in an area of map unit 1041. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles.

A--0 to 4 inches; light brownish gray (10YR 6/2) gravelly loam, dark grayish brown (10YR 4/2) moist; weak thick platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine vesicular pores; thin lime coats on undersides of pebbles; 25 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

Bk1--4 to 15 inches; light gray (10YR 7/2) gravelly loam, brown (10YR 5/3) moist; weak medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common very fine and fine roots; many very fine interstitial pores; thin lime coats on tops and thick lime coats on undersides of pebbles; 30 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

Bk2--15 to 21 inches; light gray (10YR 7/2) very gravelly loam, brown (10YR 5/3) moist; massive; slightly hard, very friable, nonsticky and nonplastic; many very fine roots; many very fine interstitial pores; thin lime coats on tops and thick lime coats on undersides of pebbles; 45 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

2Bk3--21 to 34 inches; light gray (10YR 7/2) extremely gravelly sandy loam, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; many very fine roots; common very fine interstitial pores; thin lime coats on tops and thick lime coats on undersides of pebbles;

65 percent pebbles; violently effervescent; strongly alkaline (pH 8.8); clear wavy boundary. 3Bk4--34 to 50 inches; light gray (10YR 7/2) gravelly fine sandy loam, brown (10YR 5/3) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; common very fine interstitial pores; thin lime coats on tops and thick lime coats on undersides of pebbles; 25 percent pebbles; violently effervescent; moderately alkaline (pH 8.3); abrupt wavy boundary.

4C--50 to 61 inches; light gray (10YR 7/2) extremely gravelly loamy sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; many very fine and fine interstitial pores; thin lime coats on undersides of pebbles; 65 percent pebbles; violently effervescent; moderately alkaline (pH 8.3).

Type location: Elko County, Nevada; approximately 7.5 miles east of Montello; about 2,000 feet east and 1,600 feet south of the northwest corner of section 4, T. 39 N., R. 70 E.; (41 degrees, 17 minutes, 41 seconds north latitude and 114 degrees, 03 minutes, 08 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist for short periods in winter and spring, dry late May through November.

Soil temperature: 53 to 59 degrees F.

Depth to calcic horizon: 3 to 5 inches.

Control section:

Percent clay--Averages 8 to 18 percent.

Reaction--Moderately alkaline to strongly alkaline.

Calcium carbonate equivalent--15 to 30 percent in the calcic horizon.

Rock fragments--35 to 60 percent mainly pebbles, with up to 10 percent cobbles.

A horizon:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 through 6 moist.

Chroma--2 through 4.

Bk horizons:

Hue--10YR or 2.5YR.

Value--7 or 8 dry, 4 or 5 moist.

Chroma--2 through 4.

Texture--Stratified gravelly loam through extremely gravelly coarse sandy loam with thin strata of loamy sand to loamy fine sand common in pedons.

Structure--Subangular blocky, single grain or is massive.

C horizon:

Hue--10YR or 2.5YR.

Value--6 through 8 dry, 4 through 6 dry.

Chroma--2 through 4.

Consistence--Loose, soft or slightly hard, dry; nonsticky or slightly sticky and nonplastic or slightly plastic, wet.

Other features--Thin to thick lime coats and pendants coating rock fragments or on undersides.

violently effervescent; moderately alkaline (pH 8.4); gradual wavy boundary.

C1--4 to 10 inches; white (2.5Y 8/2) silty clay loam, light yellowish brown (2.5Y 6/4) moist; moderate medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; many very fine, fine, medium and coarse roots; few very fine tubular pores; 5 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

C2--10 to 14 inches; white (2.5Y 8/2) silty clay loam, light brownish gray (2.5Y 6/2) moist; massive; hard, friable, moderately sticky and moderately plastic; 10 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

Cr--14 inches; white (2.5Y 8/2) soft calcareous siltstone; violently effervescent.

Grina Series

The Grina series consists of shallow, well drained soils that formed in residuum and colluvium derived from sedimentary rocks. Grina soils are on hills. Slopes are 15 to 50 percent. The mean annual precipitation is about 10 inches and the mean annual air temperature is about 48 degrees F.

Taxonomic class: Loamy, mixed (calcareous), mesic, shallow Xeric Torriorthents

Typical pedon: Grina silty clay loam, 15 to 50 percent slopes, is located in an area of map unit 610. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 10 percent pebbles and 5 percent cobbles.

A1--0 to 1 inch; light brownish gray (2.5Y 6/2) silty clay loam, dark brown (10YR 4/3) moist; moderate fine granular structure; slightly hard, very friable, moderately sticky and moderately plastic; many very fine and fine roots; many very fine interstitial pores; violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

A2--1 to 4 inches; light gray (2.5Y 7/2) silty clay loam, brown (10YR 5/3) moist; moderate coarse subangular blocky structure; hard, friable, moderately sticky and very plastic; many very fine, fine, and fine roots; common very fine tubular pores; 5 percent pebbles;

Type location: Elko County, Nevada; approximately 13 miles north of Wells in the Snake Mountains; about 2,000 feet east and 300 feet north of the southwest corner of section 4, T. 39 N., R. 62 E.; (41 degrees, 17 minutes, 21 seconds north latitude and 114 degrees, 58 minutes, 27 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from mid-June through October.

Soil temperature: 47 to 52 degrees F.

Depth to paralithic contact: 14 to 20 inches.

Control section:

Clay content--20 to 35 percent, when mixed
Other features--Some pedons have a thin Bk horizon immediately above the paralithic contact.

Calcium carbonate equivalent--20 to 40 percent by weight of less than 20 millimeter fraction.

Rock fragments--0 to 15 percent when mixed.

A horizons:

Hue--10YR or 2.5Y.

Value--5 through 7 dry, 3 through 5 moist.

Chroma--2 or 3.

C horizons:

Hue--10YR or 2.5Y.

Value--6 through 8 dry, 5 through 7 moist.

Chroma--2 through 4.

Texture--Loam, silt loam, or silty clay loam.
 Structure--Weak or moderate, very fine to medium subangular blocky, very fine or fine angular blocky, very thin to thick platy, or the horizon is massive.
 Effervescence--Strongly effervescent or violently effervescent.

Cr horizon:

Hue--10YR through 5Y.
 Value--7 or 8 dry, 5 through 7 moist.
 Chroma--2 or 3.
 Consistence--Soft sedimentary material that is hard to extremely hard dry, and firm to very firm moist.
 Other features--Precipitated secondary carbonates or gypsum in filaments or threads and iron-manganese stains are common along fracture planes.

Gumble Series

The Gumble series consists of shallow, well drained soils that formed in residuum and colluvium derived from sedimentary rocks. Gumble soils are on hills and pediments. Slopes are 2 to 15 percent. The mean annual precipitation is about 10 inches, and the mean annual temperature is about 47 degrees F.

Taxonomic class: Clayey, montmorillonitic, mesic, shallow Xerollic Haplargids

Typical pedon: Gumble gravelly sandy loam, 2 to 8 percent slopes, is located in an area of map unit 240. (Colors are for dry soils unless otherwise noted.) The surface is partially covered with 30 percent pebbles.

A1--0 to 2 inches; light brownish gray (10YR 6/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; weak thick platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine and common fine interstitial pores; 30 percent pebbles; neutral (pH 7.2); clear wavy boundary.

A2--2 to 4 inches; light gray (10YR 7/2) gravelly loam, dark grayish brown (10YR 4/2) moist; moderate thick platy structure; slightly hard, friable, slightly sticky and moderately plastic; many very fine and common fine roots; many

very fine interstitial and few fine tubular pores; 25 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

Bt1--4 to 9 inches; brown (10YR 5/3) clay, dark brown (10YR 3/3) moist; strong medium prismatic structure parting to strong medium angular blocky; very hard, very firm, very sticky and very plastic; common very fine roots; few very fine interstitial pores; continuous distinct stress surfaces on faces of peds; 5 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

Bt2--9 to 13 inches; brown (10YR 5/3) clay, brown (10YR 4/3) moist; moderate medium prismatic structure parting to strong medium angular blocky; very hard, very firm, very sticky and very plastic; common very fine exped roots; common very fine interstitial pores; many moderately thick clay films on faces of peds and lining pores; 5 percent pebbles; slightly alkaline (pH 7.5); clear wavy boundary.

Btk--13 to 16 inches; pale brown (10YR 6/3) silty clay, brown (10YR 4/3) moist; weak medium prismatic structure; very hard, firm, very sticky and very plastic; few very fine roots; common very fine interstitial and few fine tubular pores; few moderately thick clay films on faces of peds; common fine irregularly shaped lime filaments; 5 percent pebbles; strongly effervescent; moderately alkaline (pH 8.0); clear wavy boundary.

Cr--16 to 24 inches; pale brown (10YR 6/3) soft siltstone, brown (10YR 4/3) moist; few fine prominent dark yellowish brown (10YR 4/4) mottles.

Type location: Elko County, Nevada; approximately 20 miles northeast of Wells in the Windermere Hills; about 2,400 feet east and 75 feet north of the southwest corner of section 17, T. 39 N., R. 65 E.; (41 degrees, 15 minutes, 27 seconds north latitude and 114 degrees, 39 minutes, 14 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry but are moist in winter and spring.

Soil temperature: 47 to 50 degrees F.

Solum thickness: 14 to 20 inches.

Depth to paralithic contact: 14 to 20 inches.

Reaction: Neutral or slightly alkaline in the upper solum and slightly alkaline or moderately

alkaline in the lower part.

Control section:

Clay content--40 to 60 percent.

Rock fragments--5 to 35 percent, mostly pebbles with up to 10 percent cobbles in some pedons.

A horizons:

Value--5 through 7 dry, 3 or 4 moist.

Chroma--2 or 3.

Bt horizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--3 or 4.

Texture--Clay or gravelly clay.

Sand fraction--More than 15 percent sand coarser than very fine sand.

Btk horizon:

Value--4 or 5 moist.

Chroma--3 or 4.

Texture--Silty clay loam or silty clay.

Rock fragments--0 to 5 percent.

Hackwood Series

The Hackwood series consists of very deep, moderately well drained soils that formed in colluvium derived from mixed rocks. Hackwood soils are on mountains. Slopes are 15 to 50 percent. The mean annual precipitation is about 18 inches and the mean annual temperature is about 41 degrees F.

Taxonomic class: Fine-loamy, mixed Pachic Cryoborolls

Typical pedon: Hackwood gravelly loam, 30 to 50 percent slopes, is located in an area of map unit 802. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 15 percent pebbles.

Oi--2 to 0 inches; slightly decomposed aspen leaves and twigs; abrupt wavy boundary.

A1--0 to 4 inches; dark gray (10YR 4/1) gravelly loam, black (10YR 2/1) moist; weak fine and medium granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine interstitial pores; 15 percent pebbles; neutral (pH 6.8); clear wavy boundary.

A2--4 to 8 inches; dark grayish brown (10YR 4/2) gravelly silt loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine, fine, and few medium roots; many very fine and common fine tubular pores; 20 percent pebbles; neutral (pH 6.7); clear wavy boundary.

A3--8 to 30 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine and few medium roots; many very fine interstitial, common very fine and fine tubular pores; 25 percent pebbles; neutral (pH 6.7); clear wavy boundary.

2C1--30 to 34 inches; light brownish gray (10YR 6/2) very gravelly clay loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; few very fine and fine roots; common very fine and fine interstitial and tubular pores; 35 percent pebbles; neutral (pH 6.6); clear wavy boundary.

2C2--34 to 61 inches; pale brown (10YR 6/3) very gravelly clay loam, brown (10YR 4/3) moist; massive; hard, friable, moderately sticky and moderately plastic; few very fine and fine roots; common very fine interstitial, few very fine and fine tubular pores; common thin silt coats lining pores and coating rock fragments; 45 percent pebbles and 5 percent cobbles; slightly acid (pH 6.5).

Type location: Elko County, Nevada; approximately 19 miles north of Wells in the Snake Mountains; about 1,400 feet east and 600 feet south of the northwest corner of section 28, T. 41 N., R. 62 E.; (41 degrees, 25 minutes, 33 seconds north latitude and 114 degrees, 58 minutes, 02 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist late fall through summer, dry September and October, additional soil moisture is supplied by lateral water movement in lower part of the control section or substratum. This additional moisture is transitory and dependent on snowpack and is sporadic.

Soil temperature: 38 to 44 degrees F.

Average summer soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 16 to 35 inches.

Depth to the 2C horizon: 30 to 49 inches.

Control section:

Clay content--Averages 18 to 30 percent.

Reaction--Neutral to slightly acid, decreasing with depth.

Rock fragments--Averages 15 to 35 percent, mainly pebbles.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--1 through 3 dry, 1 or 2 moist.

2C horizons:

Hue--2.5Y or 10YR.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Texture--Very gravelly loam, very gravelly clay loam, very gravelly silty clay loam.

Rock fragments--35 to 50 percent pebbles.

Silt coats--Pores lined with very thin reorientated silt coatings or uncoated mineral grains.

Halleck Series

The Halleck series consists of very deep, poorly drained soils that formed in alluvium derived from mixed rocks with a component of loess and volcanic ash. The Halleck soils are on flood plains. Slopes are 0 to 4 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Fine-silty, mixed (calcareous), frigid Cumulic Haplaquolls

Typical pedon: Halleck silt loam, drained, gravelly substratum, 0 to 2 percent slopes, is located in an area of map unit 521. (Colors are for dry soil unless otherwise noted.)

A1--0 to 3 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak thin platy structure parting to weak very fine granular; soft, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; few very fine interstitial pores; few fine soft lime masses; violently effervescent; moderately alkaline (pH 8.0); clear smooth boundary.

A2--3 to 12 inches; gray (10YR 5/1) silt loam, black (10YR 2/1) moist; common fine granular structure; soft, very friable, slightly sticky and slightly plastic; few very fine and common fine roots; common very fine interstitial pores; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

A3--12 to 21 inches; dark gray (10YR 4/1) silt loam, black (10YR 2/1) moist; common fine granular structure; soft, very friable, moderately sticky and slightly plastic; common fine and few medium roots; many very fine and few fine tubular pores; violently effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

A4--21 to 45 inches; gray (10YR 5/1) and very dark gray (10YR 3/1) silty clay loam, with variegated very dark gray (10YR 3/1) and black (10YR 2/1) moist; strong very fine angular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; few fine roots; many very fine and fine tubular pores; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Cg1--45 to 52 inches; gray (5Y 6/1) silty clay loam, dark gray (5Y 4/1) moist; common fine distinct olive yellow (2.5Y 6/6) mottles; massive; hard, firm, moderately sticky and moderately plastic; few fine tubular pores; 5 percent pebbles; strongly effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Cg2--52 to 61 inches; gray (5Y 6/1) very gravelly clay loam, dark gray (5Y 4/1) moist; common fine distinct olive yellow (2.5Y 6/6) mottles; massive; slightly hard, friable, moderately sticky and moderately plastic; few fine interstitial pores; 50 percent pebbles; strongly effervescent; moderately alkaline (pH 8.4).

Type location: Elko County, Nevada; approximately 8 miles northwest of Wells; about 100 feet east of the northwest corner of section 6, T. 38 N., R. 62 E.; (41 degrees, 12 minutes, 56 second north latitude and 115 degrees, 01 minute, 15 seconds west longitude.)

Range in Characteristics:

Soil moisture: Saturated at or near the surface for at least one month during most years, mainly during the late winter through early summer months.

Soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 31 to 60 inches.

Control section:

Clay content--20 to 35 percent.

Sand fraction--Less than 15 percent fine sand and coarser.

Reaction--Slightly alkaline or moderately alkaline.

Effervescence--Slightly effervescent to violently effervescent.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--1 or 2 dry and moist.

Other features--Thin strata of clay loam or loam are present in the lower subhorizons of some pedons. Buried A horizons are in many pedons.

C horizons:

Hue--5GY, 5Y, 2.5Y, 10YR.

Value--6 or 7 dry.

Chroma--1 or 2.

Texture--Stratified loam to silty clay loam, but are dominantly clay loam or silty clay loam.

Other features--Gravelly substratum or drained phases are recognized.

Hapgood Series

The Hapgood series consist of deep, well drained soils that formed in colluvium derived from mixed rocks, loess, and volcanic ash. The Hapgood soils are on mountains and hills. Slopes are 15 to 50 percent. The mean annual precipitation is about 16 inches and the mean annual temperature is about 42 degrees F.

Taxonomic class: Loamy-skeletal, mixed Pachic Cryoborolls

Typical pedon: Hapgood very gravelly loam, 30 to 50 percent slopes, is located in an area of map unit 744. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 40 percent pebbles.

A1--0 to 4 inches; dark grayish brown (10YR 4/2) very gravelly loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure parting to strong fine and medium granular; soft, very friable, slightly sticky and

slightly plastic; many very fine, fine, and few medium roots; many very fine interstitial pores; 45 percent pebbles; neutral (pH 6.6); clear wavy boundary.

A2--4 to 13 inches; dark grayish brown (10YR 4/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure parting to moderate fine granular; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, medium and common coarse roots; common very fine interstitial and tubular pores; 45 percent pebbles; neutral (pH 6.6); gradual wavy boundary.

A3--13 to 31 inches; dark grayish brown (10YR 4/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, common fine and few medium roots; many very fine interstitial and common very fine tubular pores; 45 percent pebbles; slightly acid (pH 6.4); clear wavy boundary.

C--31 to 50 inches; yellowish brown (10YR 5/4) very gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine, and few medium roots; many very fine interstitial and few fine tubular pores; common thin silt coats on faces of peds and lining pores; 40 percent pebbles and 5 percent cobbles; slightly acid (pH 6.4); clear wavy boundary.

R--50 inches; hard siltstone.

Type location: Elko County, Nevada; approximately 2 miles west of H.D. Summit; about 2,100 feet west and 500 feet south of the northeast corner of section 21, T. 40 N., R. 63 E.; (41 degrees, 20 minutes, 33 seconds north latitude and 114 degrees, 51 minutes, 18 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry late July through early October.

Soil temperature: 38 to 47 degrees F.

Average summer soil temperature: 55 to 59 degrees F.

Mollic epipedon thickness: 16 to 60 inches.

Depth to bedrock: 40 to more than 60 inches.

Control section:

Clay content--18 to 27 percent.
 Reaction--Slightly acid or neutral.
 Rock fragments--35 to 50 percent, dominantly pebbles.

A horizons:

Value--2 through 5 dry, 2 or 3 moist.
 Chroma--1 through 3 in most pedons, chroma of 1 is common only in A1 horizon and chroma of 3 is common only in A3 horizon or below.
 Base saturation--50 to 75 percent in upper part.

C horizon:

Hue--10YR or 7.5YR.
 Value--4 through 6 dry, 3 through 5 moist.
 Chroma--2 through 6.
 Texture--Predominantly loam, but strata of fine sandy loam, sandy loam, silt loam or clay loam are permissible.
 Other features--Some pedons lack C horizons where the mollic epipedon rests on the bedrock at depths less than 48 inches.

Hardhat Series

The Hardhat series consists of very deep, well drained soils that formed in alluvium derived from mixed rocks over lacustrine sediments. Hardhat soils are on fan skirts. Slopes are 2 to 8 percent. The mean annual precipitation is about 6 inches and the mean annual temperature is about 49 degrees F.

Taxonomic class: Coarse-loamy, mixed (calcareous), mesic Durorthic Torriorthents

Typical pedon: Hardhat silt loam, 2 to 8 percent slopes, is located in Elko County, Nevada, southeast part in an area of map unit 340. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; light brownish gray (2.5Y 6/2) silt loam, dark grayish brown (10YR 4/2) moist; strong thick platy structure parting to strong very thin platy; hard, very friable, slightly sticky and slightly plastic; few very fine roots; many very fine vesicular pores; violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

A2--2 to 5 inches; light gray (10YR 7/2) silt loam, brown (10YR 4/3) moist; moderate coarse prismatic structure parting to strong very thin platy; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine interstitial and few very fine vesicular pores; violently effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

Bqk--5 to 10 inches; very pale brown (10YR 7/3) silt loam, brown (10YR 5/3) moist; weak coarse prismatic structure parting to moderate thin platy; hard, friable, slightly sticky and slightly plastic; common very fine, fine, and few medium horizontal exped roots; common very fine tubular pores; few thin glassy silica bridges between mineral grains and coats on faces of peds; few fine lime filaments; violently effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

Bk--10 to 17 inches; very pale brown (10YR 7/3) silt loam, yellowish brown (10YR 5/4) moist; massive; soft, very friable, slightly sticky and slightly plastic; common very fine, fine and medium roots; common very fine tubular pores; violently effervescent; strongly alkaline (pH 8.8); abrupt smooth boundary.

2Bqk--17 to 23 inches; light gray (10YR 7/2) loam, brown (10YR 5/3) moist; strong thin and medium platy structure; very hard, firm, and brittle, slightly sticky and slightly plastic; common very fine horizontal exped roots; many very fine vesicular pores; many fine lime coats on peds and lining some pores; continuous brittle matrix; violently effervescent; very strongly alkaline (pH 9.4); abrupt wavy boundary.

3Bqky1--23 to 32 inches; light gray (10YR 7/2) stratified lenses of sandy loam and gravelly sand, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine, fine, and medium roots; common very fine tubular pores; 20 percent discontinuously weakly silica and lime cemented; 20 percent hard, firm 5 to 15 millimeter durinodes; few fine gypsum filaments; 30 percent pebbles; thin lime coats on undersides of pebbles; violently effervescent; strongly alkaline (pH 8.8); clear wavy boundary.

3Bqky2--32 to 56 inches; white (5Y 8/2) very fine sandy loam, olive (5Y 5/3) moist; common fine distinct yellowish brown (10YR 5/6) and brown

(10YR 4/3) moist relict mottles; moderate very thin platy structure; hard, firm, and brittle, nonsticky and nonplastic; few very fine roots; common very fine interstitial pores; 30 percent very hard, very firm durinodes; few fine gypsum filaments; continuous brittle matrix; violently effervescent; strongly alkaline (pH 8.6); gradual wavy boundary.

3Bqky3--56 to 60 inches; light gray (2.5Y 7/2) very gravelly sandy loam, grayish brown (2.5Y 5/2) moist; strong thin platy structure; hard, firm, and brittle, nonsticky and nonplastic; few very fine interstitial pores; few fine gypsum filaments; many fine manganese coats on faces of peds; 40 percent pebbles; continuous brittle matrix; violently effervescent; moderately alkaline (pH 8.0)

Type location: Elko County, Nevada; approximately 10 miles south of Montello; about 50 feet south and 25 feet west of the northeast corner of section 3, T. 37 N., R. 69 E.; (41 degrees, 07 minutes, 29 seconds north latitude and 114 degrees, 08 minutes, 27 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist for short periods in the winter and spring, dry late May through early November.

Soil temperature: 53 to 57 degrees F.

Depth to lacustrine material: 15 to 25 inches.

Depth to continuous weak brittle matrix: 10 to 20 inches.

Depth to segregated lime and silica bridging mineral grains: 4 to 10 inches.

Depth to gypsum: 12 to 25 inches.

Control section:

Clay content--8 to 18 percent.

Rock fragments--Averages 5 to 20 percent mainly pebbles.

Reaction--Moderately alkaline to very strongly alkaline.

Calcium carbonate equivalent--Averages 10 to 20 percent.

A horizons:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Bqk horizons:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 through 6 moist.

Chroma--3 or 4.

Texture--Silt loam, very fine sandy loam, or loam in the upper subhorizons and stratified very fine sandy loam to gravelly sand in the lower subhorizons.

Structure--Weak prismatic, weak to strong platy or it is massive.

Silica-lime cementation--The upper subhorizon has few to many silica bridges or coats, but the matrix is friable or very friable. Some subhorizon has continuous brittle matrix within a depth of 10 to 20 inches.

Bqky horizons:

Hue--10YR, 2.5Y, or 5Y.

Value--7 or 8 dry, 5 through 7 moist.

Chroma--2 through 4.

Texture--Stratified very fine sandy loam to very gravelly sandy loam.

Rock fragments--Pebbles are lacking in some pedons.

Structure--Platy or it is massive.

Gypsum crystals--Few or common.

Relict mottles or manganese coats--Are common in any subhorizon.

Heckison Series

The Heckison series consists of moderately deep to an indurated duripan, well drained soils that formed in alluvium derived from volcanic rocks and volcanic ash. Heckison soils are on hills and plateaus. Slopes are 2 to 8 percent. The mean annual precipitation is about 12 inches, and the mean annual temperature is about 45 degrees.

Taxonomic class: Fine-loamy, mixed, frigid Aridic Durixerolls

Typical pedon: Heckison silt loam, 2 to 8 percent slopes, is located in an area of map unit 260. (Colors are for dry soil unless otherwise noted.)

A--0 to 6 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky, and slightly plastic; common very fine, few fine, medium and coarse roots; common very fine

and fine tubular and interstitial pores; 5 percent pebbles; neutral (pH 7.0); abrupt smooth boundary.

Bt1--6 to 18 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; moderate coarse subangular blocky structure; hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; common very fine and fine tubular pores; few clay films lining pores; 10 percent pebbles; neutral (pH 7.2); abrupt smooth boundary.

Bt2--18 to 28 inches; brown (10YR 5/3) silty clay loam, dark brown (10YR 4/3) moist; moderate medium prismatic structure parting to moderate coarse subangular blocky; very hard, firm, moderately sticky and moderately plastic; few very fine and fine roots; few very fine and fine tubular pores; common moderately thick clay films lining pores; 10 percent pebbles; slightly alkaline (pH 7.4); abrupt smooth boundary.

Bk--28 to 33 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 4/3) moist; weak medium prismatic structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; few very fine tubular pores; 5 percent pebbles; strongly effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.

Bqkm--33 to 39 inches; very pale brown (10YR 7/3) indurated duripan, pale brown (10YR 6/3) moist; 1 to 2 millimeter thick indurated continuous laminae cap; abrupt wavy boundary.

R--39 inches; welded tuff.

Type location: Elko County, Nevada; approximately 11 miles east of Jackpot; about 1,300 feet east of the northwest corner of section 11, T. 47 N., R. 66 E.; (41 degrees, 59 minutes, 05 seconds north latitude and 114 degrees, 27 minutes, 25 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry late June through October.

Soil temperature: 45 to 47 degrees F.

Mollic epipedon thickness: 7 to 19 inches.

Depth to secondary carbonates: 12 to 20 inches.

Depth to duripan: 21 to 36 inches.

Depth to bedrock: 22 to 40 inches.

Control section:

Clay content--24 to 35 percent.

Rock fragments--0 to 15 percent pebbles.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Value--4 through 6 dry, 2 through 4 moist

Chroma--2 through 4.

Textures--Silt loam, silty clay loam.

Bk horizon:

Value--6 through 8 dry, 4 through 7 moist.

Chroma--2 through 4.

Texture--Silt loam, gravelly silt loam or very fine sandy loam.

Effervescence--Strongly effervescent or violently effervescent.

Hogmalat Series

The Hogmalat series consists of very shallow and shallow, well drained soils that formed in residuum derived from volcanic rocks. Hogmalat soils are on mountains. Slopes are 4 to 50 percent. The mean annual precipitation is about 20 inches, and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy-skeletal, mixed Argic Lithic Cryoborolls

Typical pedon: Hogmalat very gravelly loam, 4 to 15 percent slopes, is located in an area of map unit 747. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 60 percent pebbles and 5 percent cobbles.

A--0 to 3 inches; very dark grayish brown (10YR 3/2) very gravelly loam, very dark brown (10YR 2/2) moist; weak very fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine interstitial pores; 45 percent pebbles; moderately acid (pH 5.8); abrupt smooth boundary.

Bt--3 to 10 inches; brown (10YR 5/3) very gravelly clay loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine and medium roots; many very fine tubular pores; few thin colloid stains on mineral grains; 45

percent pebbles; moderately acid (pH 5.8); abrupt smooth boundary.
R--10 inches; welded tuff.

Type location: Elko County, Nevada; approximately 10 miles west of Jackpot; about 150 feet north and 1,200 feet west of the southeast corner of section 9, T. 47 N., R. 63 E.; (41 degrees, 58 minutes, 15 seconds north latitude and 114 degrees, 50 minutes, 15 second west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; dry late July through September.

Soil temperature: 37 to 40 degrees F.

Summer temperature: 54 to 57 degrees F.

Mollic epipedon thickness: 9 to 20 inches.

Depth to bedrock: 9 to 20 inches.

Base saturation: 50 to 55 percent.

Control section:

Clay content--24 to 34 percent.

Rock fragments--35 to 55 percent, mainly pebbles.

Reaction--Strongly acid to moderately acid.

A horizon:

Value--3 through 5 dry, 2 or 3 moist.

Chroma--1 through 3.

Bt horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Textures--Very gravelly loam, very gravelly clay loam.

Structure--Weak or moderate subangular blocky or angular blocky.

Holborn Series

The Holborn series consists of very shallow, well drained soils that formed in residuum and colluvium derived from mixed rocks. Holborn soils are on hills and pediments. Slopes are 4 to 50 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy, mixed (calcareous), mesic, shallow Xeric Torriorthents

Typical pedon: Holborn gravelly loam, 4 to 15 percent slopes, is located in an area of map unit 1060. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 25 percent pebbles.

A1--0 to 1 inch; pale brown (10YR 6/3) gravelly loam, brown (10YR 4/3) moist; weak thin platy structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; many very fine, common fine, and few medium tubular pores; 30 percent pebbles; strongly effervescent; strongly alkaline (pH 8.5); abrupt wavy boundary.

A2--1 to 3 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, friable, slightly sticky and slightly plastic; many very fine, common fine, and few medium roots; common very fine and few fine tubular pores; 15 percent pebbles; strongly effervescent; strongly alkaline (pH 8.5); clear wavy boundary.

Bk--3 to 7 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 4/3) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; common fine, very fine, and few medium roots; common very fine and few fine tubular pores; thin lime coats on undersides of pebbles; 25 percent pebbles; violently effervescent; strongly alkaline (pH 8.5); abrupt wavy boundary.

Cr--7 to 13 inches; soft weathered sandstone.

Type location: Elko County, Nevada; approximately 7 miles west of Montello; about 2,500 feet west and 2,600 feet south of the northeast corner of section 5 T. 39 N., R. 68 E.; (41 degrees, 17 minutes, 45 seconds north latitude and 114 degrees, 18 minutes, 19 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry June through October.

Soil temperature: 47 to 52 degrees F.

Depth to paralithic contact: 6 to 10 inches.

Control section:

Percent clay--Averages 18 to 30.

Rock fragments--15 to 35 percent, mainly pebbles.

Reaction--Moderately alkaline or strongly alkaline.

Calcium carbonate equivalent--Averages 5 to 30 percent.

Effervescence--Strongly effervescent to violently effervescent.

A horizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Other features--Combined thickness of the A horizon is 1 to 6 inches.

Bk horizon:

Hue--2.5YR or 10YR.

Value--5 through 7 dry, 4 through 6 moist.

Chroma--3 or 4.

Texture--Gravelly loam, gravelly clay loam.

Hooplite Series

The Hooplite series consists of very shallow and shallow, well drained soils that formed in residuum and colluvium derived volcanic rocks. Hooplite soils are on hills. Slopes range from 4 to 50 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy-skeletal, mixed, mesic Lithic Xerollic Haplargids

Typical pedon: Hooplite very gravelly loam, 4 to 15 percent slopes, is located in an area of map unit 660. (Colors are for dry soil unless otherwise noted.)

A1--0 to 1 inch; light brownish gray (10YR 6/2) very gravelly loam, dark grayish brown (10YR 4/2) moist; moderate thin and medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, and few medium roots; many fine, common medium, and coarse vesicular pores; 55 percent pebbles; 5 percent of horizon has slight effervescence; slightly alkaline (pH 7.6); abrupt wavy boundary.

A2--1 to 3 inches; light brownish gray (10YR 6/2) very gravelly loam, dark grayish brown (10YR 4/2) moist; moderate medium and coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, and few medium roots; many very fine, fine, and common medium and coarse

vesicular pores; 35 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

A3--3 to 6 inches; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; moderate fine subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine and fine few medium roots; common very fine and fine tubular pores; 35 percent pebbles, slightly alkaline (pH 7.8); clear wavy boundary.

Bt--6 to 9 inches; brown (10YR 5/3) very gravelly clay loam, dark yellowish brown (10YR 4/4) moist; moderate fine angular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; few very fine, fine and medium roots; few very fine and fine tubular pores; very few thin clay films on faces of peds and on pebbles; 50 percent of rock fragments have very thin lime and silica pendants; 5 percent of horizon has fine, platelike lime and silica fragments; 50 percent pebbles; 5 percent of horizon has slight effervescent; moderately alkaline (pH 8.0).

R--9 inches; highly fractured hard siltstone with brown (10YR 5/3) clay loam in fractures; few very fine, fine and medium roots in fractures.

Type location: Elko County, Nevada; approximately 2 miles north of Boies Reservoir approximately 1,500 feet north and 1,500 feet west of the southeast corner of section 1, T. 43 N., R. 62 E.; (41 degrees, 38 minutes, 54 seconds north latitude and 114 degrees, 54 minutes, 03 seconds east longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist during winter and early spring, dry mid-June through October.

Soil temperature: 47 to 52 degrees F.

Depth to hard bedrock: 6 to 14 inches.

Control section:

Clay content--18 to 25 percent, when mixed.

Rock fragments--35 to 50 percent pebbles, 0 to 10 percent cobbles.

Reaction--Slightly alkaline or moderately alkaline.

Other features--Some pedons have up to 3 inches of highly fractured bedrock overlying the lithic contact.

A horizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Effervescence--Noneffervescent or slightly effervescent.

Bt horizon:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 through 4.

Texture--Very gravelly loam, very gravelly clay loam.

Rock fragments--35 to 50 percent.

Structure--Subangular blocky, angular blocky or granular.

Effervescence--Slightly effervescent or strongly effervescent.

Hopeka Series

The Hopeka series consists of very shallow, well drained soils that formed in residuum and colluvium derived from limestone and dolomite. Hopeka soils are on hills and mountains. Slopes are 15 to 75 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy-skeletal, carbonatic, frigid Lithic Xeric Torriorthents

Typical pedon: Hopeka very gravelly loam, 15 to 50 percent slopes, is located in an area of map unit 2051. (Colors are for dry soil unless otherwise noted.) The surface is partially covered with 50 percent pebbles, 10 percent cobbles, and 5 percent stones.

A--0 to 3 inches; light gray (10YR 7/2) very gravelly loam, dark grayish brown (10YR 4/2) moist; weak thick platy structure; soft, very friable, slightly sticky and slightly plastic; common very fine roots; many fine interstitial and tubular pores; 35 percent pebbles; strongly effervescent; strongly alkaline (pH 8.5); clear wavy boundary.

C--3 to 9 inches; light gray (10YR 7/2) very gravelly loam, dark brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine, medium and coarse roots; common very fine and fine tubular pores; 50 percent pebbles; violently effervescent; strongly alkaline (pH

8.5); abrupt irregular boundary.
R--9 inches; hard, fractured limestone.

Type location: Elko County, Nevada; approximately 10 miles northwest of Montello; about 1,260 feet east and 1,675 feet north of the southwest corner of section 12, T. 40 N., R. 67 E.; (41 degrees, 21 minutes, 57 seconds north latitude and 114 degrees, 20 minutes, 57 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring, dry June through mid October.

Soil temperature: 43 to 47 degrees.

Depth to bedrock: 4 to 10 inches.

Control section:

Clay content--18 to 25 percent.

Effervescence--Violently effervescent, but some surface layers are strongly effervescent.

Calcium carbonate equivalent 40 to 85 percent.

Reaction--Moderately alkaline or strongly alkaline.

Rock fragments--35 to 60 percent limestone or dolomite pebbles, cobbles or stones.

A horizon:

Hue--10YR or 7.5YR.

Value--5 through 7 dry, 3 or 4 moist.

Chroma--2 or 3.

C horizon:

Hue--10YR or 7.5YR.

Value--5 through 7 dry, 3 or 4 moist.

Chroma--2 or 3.

Structure--Weak to moderate subangular blocky or it is massive.

Hundraw Series

The Hundraw series consists of very shallow, well drained soils that formed in residuum and colluvium derived from sedimentary rocks, loess, and volcanic ash. The Hundraw soils are on hills and pediments. Slopes are 2 to 50 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy, mixed (calcareous) mesic, shallow Xeric Torriorthents

Typical pedon: Hundraw gravelly loam, 2 to 8 percent slopes, is located in an area of map unit 3032. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles.

A1--0 to 1 inch; light gray (2.5Y 7/2) gravelly loam, grayish brown (2.5Y 5/2) moist; moderate medium and thick platy structure; hard, friable, slightly sticky and slightly plastic; few very fine roots; many very fine interstitial, few fine vesicular and common fine and medium tubular pores; 25 percent pebbles; strongly effervescent; moderately alkaline (pH 8.3); abrupt smooth boundary.

A2--1 to 3 inches; light gray (10YR 7/1) gravelly loam, dark grayish brown (10YR 4/2) moist; moderate thin and medium platy structure; slightly hard, very friable; slightly sticky and slightly plastic; few very fine and fine roots; many very fine and fine interstitial and tubular pores; 15 percent pebbles; thin lime coats on undersides of pebbles; strongly effervescent; moderately alkaline (pH 8.3); abrupt smooth boundary.

Bk--3 to 8 inches; light brownish gray (2.5Y 6/2) fine sandy loam, dark grayish brown (2.5Y 4/2) moist; weak fine and medium subangular blocky structure; slightly hard, very friable; slightly sticky and slightly plastic; common very fine, fine and medium roots; common very fine and fine horizontal roots at the lower horizon boundary; common very fine interstitial and few fine tubular pores; 10 percent fine soft tuff fragments; medium lime pendants on the undersides of pebbles; 5 percent hard pebbles; strongly effervescent; moderately alkaline (pH 8.3); abrupt smooth boundary.

Cr--8 inches; white (2.5Y 8/2) soft, fractured tuff, light brownish gray (2.5Y 6/2) moist; moderately thick lime coats and few very fine roots along fractures.

Type location: Elko County, Nevada; approximately 15 miles northwest of Montello; about 625 feet east and 1,625 feet south of the northwest corner of section 5 T. 40 N., R. 67 E.; (41 degrees, 22 minutes, 44 seconds north latitude and 114 degrees, 25 minutes, 42 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the winter and spring, dry June through October.

Soil temperature: 47 to 52 degrees F.

Depth to paralithic contact: 4 to 10 inches.

Control section:

Percent clay--8 to 18 percent.

Rock fragments--Averages 5 to 20 percent, mainly pebbles.

Effervescence--Strongly effervescent or violently effervescent.

Calcium carbonate equivalent--5 to 15 percent.

A horizons:

Hue--10YR, 2.5Y and 5Y

Value--6 or 7; 3 through 5 moist.

Chroma--2 through 4.

Bk horizon:

Hue--10YR, 2.5Y and 5Y.

Value--6 or 7, 4 or 5 moist.

Chroma--2 through 4.

Clay content--8 to 18 percent.

Rock fragments--Averages 5 to 15 percent, mostly pebbles.

Structure--Weak or moderate, fine or medium subangular blocky.

Hunewill Series

The Hunewill series consists of very deep, well drained soils that formed in alluvium derived from mixed rocks. They are on inset fans and fan remnants. Slopes are 2 to 30 percent. Mean annual temperature is about 49 degrees F.; and the mean annual precipitation is about 8 inches.

Taxonomic class: Loamy-skeletal, mixed, mesic, Xerollic Haplargids

Typical pedon: Hunewill gravelly loam, 2 to 4 percent slopes, is located in an area of map unit 082. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 15 percent pebbles.

Ap--0 to 3 inches; pale brown (10YR 6/3) gravelly loam, dark brown (10YR 3/3) moist; weak very fine granular structure; soft, very friable, nonsticky and slightly plastic; many very fine roots; many very fine tubular pores; 15 percent

pebbles; neutral (pH 7.2); abrupt wavy boundary.

A2--3 to 6 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine tubular pores; 20 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt1--6 to 16 inches; pale brown (10YR 6/3) very gravelly clay loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; common very fine roots; common very fine and few fine tubular pores; common thin clay films on faces of peds and lining pores; 35 percent pebbles; neutral (pH 7.2); clear wavy boundary.

2Bt2--16 to 20 inches; brown (10YR 5/3) very gravelly clay loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine roots; common very fine and few fine tubular pores; common thin clay films on faces of peds and lining pores; 45 percent pebbles and 10 percent cobbles; neutral (pH 7.3); clear wavy boundary.

2C--20 to 61 inches; pale brown (10YR 6/3) extremely gravelly sand, brown (10YR 4/3) moist; single grain, loose, nonsticky and nonplastic; 55 percent pebbles; 20 percent cobbles; neutral (pH 7.2).

Type location: Elko County, Nevada; approximately 6 miles northwest of Wells in Bishop Flats; about 1,000 feet east and 2,500 feet north of the southwest corner of section 8, T. 38 N., R. 62 E.; (41 degrees, 11 minutes, 32 seconds north latitude and 114 degrees, 59 minutes, 58 west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from June through October.

Soil temperature: 47 to 53 degrees F.

Combined thickness of A and Bt horizons: 10 to 20 inches.

Control section:

Clay content--18 to 27 percent.

Rock fragments--35 to 50 percent.

Other features--Darker value dry reflects primarily lithochromic colors.

A horizons:

Value--5 or 6 dry, 3 or 4 moist. When the upper 7 inches are mixed, the value is more than 5.5 dry.

Chroma--2 or 3.

Bt1 horizon:

Hue--10YR or 7.5YR.

Value--4 through 6 dry, 3 or 4 moist.

Chroma--3 or 4.

Texture--Very gravelly loam, very gravelly sandy clay loam or very gravelly clay loam.

Clay content--25 to 35 percent.

Rock fragments--35 to 50 percent, mainly pebbles.

Reaction--Neutral or slightly alkaline.

2Bt2 horizon:

Texture--Very gravelly loam or very gravelly sandy loam.

Clay content--5 to 15 percent.

Rock fragments--35 to 60 percent, mainly pebbles.

Reaction--Neutral or slightly alkaline.

2C horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Texture--Extremely gravelly or cobbly sand or loamy sand.

Clay content--0 to 2 percent.

Rock fragments--60 to 80 percent rounded pebbles and cobbles.

Reaction--Neutral or slightly alkaline.

Other features--A few very thin lime coats are on the bottom of larger cobbles in some pedons.

Hunnton Series

The Hunnton series consists of moderately deep, well drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. The Hunnton soils are on fan remnants. Slopes are 2 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual air temperature is about 48 degrees F.

Taxonomic class: Fine, montmorillonitic, mesic Xerollic Durargids

Typical pedon: Hunnton silt loam, 2 to 8 percent slopes, is located in an area of map unit O94. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 20 percent pebbles.

A--0 to 8 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; moderate very thin platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and few medium roots; many very fine and fine interstitial pores; 5 percent pebbles; moderately alkaline (pH 7.9); clear smooth boundary.

Bt1--8 to 14 inches; light yellowish brown (10YR 6/4) clay, brown (10YR 4/3) moist; moderate medium prismatic structure; hard, friable, moderately sticky and moderately plastic; common very fine roots; common very fine tubular pores; many moderately thick clay films on faces of peds; 5 percent pebbles; moderately alkaline (pH 7.9); clear smooth boundary.

Bt2--14 to 22 inches; light yellowish brown (10YR 6/4) clay, brown (10YR 4/3) moist; moderate fine prismatic structure parting to strong medium subangular blocky; hard, firm, very sticky and very plastic; common very fine roots; few very fine tubular pores; many thick clay films on faces of peds and lining pores; 5 percent pebbles; moderately alkaline (pH 8.2); clear smooth boundary.

Bqkm--22 to 36 inches; very pale brown (10YR 7/3) indurated duripan, very pale brown (10YR 7/4) moist; massive; very rigid; few very fine interstitial pores; continuous 1 to 2 millimeter thick horizontal silica laminae at upper surface; violently effervescent; 45 percent pebbles; moderately alkaline (pH 8.4); clear smooth boundary.

2Cqk1--36 to 50 inches; very pale brown (10YR 8/3) very gravelly loamy sand, very pale brown (10YR 7/4) moist; massive; very hard, very firm, nonsticky and nonplastic; many very fine interstitial pores; 45 percent pebbles; 40 percent strong silica cementation and 30 percent weak silica cementation; violently effervescent; moderately alkaline (pH 8.4); gradual smooth boundary.

2Cqk2--50 to 60 inches; very pale brown (10YR 8/3) extremely gravelly loamy sand, very pale brown (10YR 7/4) moist; massive; hard, firm, nonsticky and nonplastic; 70 percent pebbles; 70 percent discontinuous weak silica

cementation; strongly effervescent; strongly alkaline (pH 8.6).

Type location: Elko County, Nevada; approximately 10 miles northwest of Wells; about 2,200 feet north and 700 feet west of the southeast corner of section 26, T. 39 N., R. 61 E.; (41 degrees, 14 minutes, 11 seconds north latitude and 115 degrees, 02 minutes, 35 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from June through October.

Soil temperature: 47 to 52 degrees F.

Depth to duripan: 20 to 40 inches.

Depth to lime: 19 to 32 inches.

Abrupt features: Greater than 15 percent increase in clay between the A and the Bt1 horizon.

Control section:

Clay content--45 to 55 percent.

Other features--Some pedons have a 4 to 8 inch thick continuously brittle matrix Bqk horizon above the duripan.

Rock fragments--0 to 25 percent, mainly pebbles.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Reaction--Slightly alkaline or moderately alkaline.

Bt horizons:

Hue--10YR or 7.5YR.

Value--5 through 7 dry, 3 through 5 moist.

Chroma--3 or 4.

Texture--Clay or gravelly clay.

Clay content--45 to 55 percent.

Rock fragments--0 to 25 percent, mainly pebbles.

Structure--Weak or moderate, very fine to medium subangular or angular blocky or prismatic.

Reaction--Slightly alkaline or moderately alkaline.

Effervescence--Noneffervescent in the upper subhorizons, noneffervescent to strongly effervescent in the lower subhorizons.

Other features--Some pedons have a 4 to 7 inch thick loam or clay loam Bt1 horizon with thin clay films.

Bqkm horizon:

Value--7 or 8 dry, 4 through 7 moist.
 Chroma--2 or 3 dry, 3 or 4 moist.
 Structure--Massive, or has weak medium to very thick platy structure.
 Other features--Some pedons have strongly silica cemented horizons with 40 to 60 percent pebbles below the indurated duripan.

2Cqk horizons:

Value--6 through 8 dry, 4 through 7 moist.
 Chroma--2 through 4 dry, 3 or 4 moist.
 Texture--Very gravelly sandy loam, very gravelly loamy sand or extremely gravelly loamy sand.
 Clay content--2 to 10 percent.
 Rock fragments--40 to 70 percent, mostly pebbles.
 Reaction--Moderately alkaline or strongly alkaline.
 Cementation--This horizon has a discontinuously to continuously brittle matrix with discontinuous one-half to 1 millimeter thick silica laminae common. Some pedons have up to 40 percent strong discontinuous silica cementation.

Hussell Series

The Hussell series consists of very deep, well drained soils that formed in alluvium derived from granitic rocks. The Hussell soils are on fan remnants. Slopes are 2 to 30 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Coarse-loamy, mixed, mesic Durixerollic Haplargids

Typical pedon: Hussell coarse sandy loam, 8 to 30 percent slopes, is located in an area of map unit 320. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 2 percent pebbles.

A--0 to 4 inches; grayish brown (10YR 5/2) coarse sandy loam, dark brown (10YR 3/3) moist; weak coarse subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; many very fine, fine, and few medium and coarse roots; many very fine

interstitial, and common very fine tubular pores; 5 percent pebbles; neutral (pH 7.2); clear smooth boundary.

Bt1--4 to 9 inches; brown (10YR 5/3) coarse sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine and medium, and few coarse roots; common very fine tubular pores; few thin clay films on faces of peds; 10 percent pebbles; slightly alkaline (pH 7.8); clear smooth boundary.

Bt2--9 to 16 inches; yellowish brown (10YR 5/4) gravelly coarse sandy loam; dark yellowish brown (10YR 3/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; common very fine tubular pores; common thin clay films bridging mineral grains; 15 percent pebbles; moderately alkaline (pH 8.0) clear smooth boundary.

2Bqk1--16 to 26 inches; pale brown (10YR 6/3) gravelly loamy coarse sand, brown (10YR 4/3) moist; massive, very hard, firm and brittle, nonsticky and nonplastic; few very fine, fine and medium roots; few very fine tubular pores; 50 percent durinodes in a continuous brittle matrix, violently effervescent; 25 percent pebbles; moderately alkaline (pH 8.2); clear smooth boundary.

2Bqk2--26 to 56 inches; pale brown (10YR 6/3) gravelly loamy coarse sand, brown (10YR 4/3) moist; massive; slightly hard, very friable; nonsticky and nonplastic; common very fine and few fine roots; few very fine tubular pores; 35 percent durinodes in a discontinuous weakly cemented matrix; 15 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

3C--56 to 65 inches; very pale brown (10YR 7/3) gravelly coarse sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; many very fine interstitial pores; strongly effervescent; 25 percent pebbles; strongly alkaline (pH 8.6).

Type location: Elko County, Nevada; approximately 14 miles south of Jackpot; about 500 feet south and 2,500 feet east of the northwest corner of section 22 T. 45 N., R. 64 E.; (41 degrees, 46 minutes, 42 seconds north latitude and 114 degrees, 43 minutes, 30 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry mid-June through late October.

Soil temperature: 47 to 52 degrees F.

Depth to 2Bqk horizon: 14 to 20 inches.

A horizon:

Value--Tend to reflect some of the darker lithochromic colors.

Chroma--2 or 3.

Reaction--Neutral or slightly alkaline.

Organic carbon content--Averages 0.3 to 0.6 percent when mixed.

Bt horizons:

Value--5 or 6 dry, 3 or 4 moist. Value of 5 dry and 3 moist tend to reflect lithochromic colors.

Chroma--3 or 4.

Texture--Coarse sandy loam, gravelly coarse sandy loam.

Clay content--8 to 15 percent.

Rock fragments--5 to 30 percent, mainly pebbles.

Structure--Subangular blocky or it is massive.

Reaction--Slightly alkaline or moderately alkaline.

2Bqk and 3C horizons:

Value--6 or 7 dry, 4 or 5 moist.

Texture--Gravelly loamy coarse sand, loamy coarse sand, gravelly coarse sand and coarse sand.

Clay content--0 to 10 percent.

Rock fragments--5 to 30 percent, mainly pebbles.

Reaction--Moderately alkaline or strongly alkaline.

Cementation--Has at least one subhorizon within 40 inches that contains a continuous brittle matrix.

Igdell Series

The Igdell series consists of moderately deep to a indurated duripan, well drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. Igdell soils are on fan remnants. Slopes are 2 to 30 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid
Abruptic Aridic Durixerolls

Typical pedon: Igdell very gravelly clay loam, 2 to 8 percent slopes is located in an area of map unit 022. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles.

A--0 to 2 inches; grayish brown (10YR 5/2) very gravelly clay loam, very dark grayish brown (10YR 3/2) moist; moderate coarse platy structure; slightly hard, very friable, moderately sticky and moderately plastic; many very fine interstitial pores; 40 percent pebbles; neutral (pH 7.2); abrupt smooth boundary.

2Bt1--2 to 9 inches; dark grayish brown (10YR 4/2) gravelly clay, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; very hard, very firm, very sticky and very plastic; common very fine and few medium roots; many very fine and few fine tubular pores; many moderately thick clay films on faces of peds and lining pores; 15 percent pebbles; neutral (pH 7.3); clear wavy boundary.

2Bt2--9 to 14 inches; brown (10YR 5/3) gravelly clay, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; hard, firm, very sticky and very plastic; common very fine roots; many very fine and few fine tubular pores; few thin clay films on faces of peds and lining pores; 15 percent pebbles and 5 percent cobbles; neutral (pH 7.3); abrupt smooth boundary.

2Bt3--14 to 28 inches; yellowish brown (10YR 5/4) clay, dark yellowish brown (10YR 4/4) moist; strong medium prismatic structure; extremely hard, extremely firm, very sticky and very plastic; few very fine exped roots; common very fine tubular pores; many stress surfaces; 5 percent pebbles; neutral (pH 7.3); clear wavy boundary.

2Bt4--28 to 31 inches; light yellowish brown (10YR 6/4) silty clay, yellowish brown (10YR 5/4) moist; few fine prominent manganese stains; moderate medium subangular blocky structure; hard, firm, very sticky and very plastic; few very fine roots; common very fine interstitial pores; common thin clay films on faces of peds and lining pores; few thin lime filaments; 5 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

2Btqk--31 to 37 inches; light yellowish brown

(10YR 6/4) gravelly loam, yellowish brown (10YR 5/4) moist; massive; hard, firm, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; few thin clay films on faces of peds and lining pores; 15 percent pebbles; discontinuous weak silica cementation; violently effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

2Bqkm--37 to 60 inches; very pale brown (10YR 7/4) indurated duripan, brownish yellow (10YR 6/6) moist; very rigid; abrupt smooth boundary.

Type location: Elko County, Nevada; approximately 20 miles north of Wells about 1,000 feet east and 1,750 feet south of the northwest corner of section 25, T. 41 N., R. 62 E.; (41 degrees, 25 minutes, 03 seconds north latitude and 114 degrees, 54 minutes, 36 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry from late June through October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 7 to 14 inches, includes upper part of argillic horizon.

Depth to lime: 20 to 33 inches.

Depth to duripan: 20 to 40 inches.

Control section:

Clay content--Averages 45 to 60 percent.

Rock fragments--10 to 35 percent, mainly pebbles.

A horizons:

Chroma--2 or 3.

Reaction--Neutral or slightly alkaline.

2Bt horizons:

Hue--10YR or 7.5YR.

Value--4 through 6 dry, 3 through 5 moist.

Chroma--2 through 4.

Texture--Clay, gravelly clay or silty clay.

Gravelly loam, gravelly clay loam, or very gravelly sandy clay loam in the subhorizon immediately above the duripan.

Rock fragments--10 to 40 percent in any one subhorizon but averages less than 35 percent.

Reaction--Neutral to moderately alkaline increasing with depth.

Other features--At least one subhorizon in the upper part has 60 to 70 percent clay.

2Bqkm horizon:

Value--7 or 8 dry.

Structure--Thick platy or is massive.

Thickness--10 to over 30 inches thick with the base extending below 40 inches.

Ixian Series

The Ixian series consists of very deep, somewhat poorly drained soils that formed in alluvium derived from mixed rocks over lacustrine sediments. The Ixian soils are on lake plains. Slopes are 0 to 4 percent. The mean annual precipitation is about 7 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Fine-silty, mixed (calcareous), mesic Aquic Torriorthents

Typical pedon: Ixian silt loam, 0 to 2 percent slopes, is located in an area of map unit 186. (Colors are for dry soil unless otherwise noted.)

A--0 to 4 inches; light gray (10YR 7/2) silt loam, dark grayish brown (10YR 4/2) moist; weak thick platy structure; hard, firm, very sticky and moderately plastic; few very fine roots; many very fine, fine, and common medium vesicular pores; violently effervescent; very strongly alkaline (pH 9.6); abrupt smooth boundary.

C--4 to 12 inches; light gray (10YR 7/2) silt loam, grayish brown (10YR 5/2) moist; moderate thin platy structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine and few fine roots; many very fine interstitial pores; violently effervescent; very strongly alkaline (pH 9.6); clear smooth boundary.

Ck--12 to 42 inches; very pale brown (10YR 7/3) silty clay loam, brown (10YR 5/3) moist; massive; very hard, very firm, very sticky and very plastic; common very fine and few fine roots; many very fine and few fine interstitial pores; few fine seams and soft masses of lime; violently effervescent; very strongly alkaline (pH 9.6); abrupt smooth boundary.

2Cy--42 to 48 inches; very pale brown (10YR 7/3) silty clay loam, brown (10YR 5/3) moist; few fine distinct light yellowish brown (10YR 6/4) mottles moist; weak thin platy structure; hard, firm, very sticky and very plastic; few very fine roots; many very fine and few fine interstitial

pores; common fine seams and soft masses of gypsum; violently effervescent; very strongly alkaline (pH 9.6); abrupt smooth boundary.

3C'--48 to 51 inches; very pale brown (10YR 7/3) loamy fine sand, brown (10YR 5/3) moist; weak thin platy structure; soft, very friable, nonsticky and nonplastic; few very fine roots; many very fine and few fine interstitial pores; violently effervescent; very strongly alkaline (pH 9.6); abrupt smooth boundary.

4C'y--51 to 63 inches; very pale brown (10YR 7/3) silty clay, brown (10YR 5/3) moist; common fine prominent yellowish brown (10YR 5/6) mottles moist; weak thin platy structure; very hard, very firm, very sticky and very plastic; many very fine interstitial pores; many silt coats lining pores; common fine and medium seams and soft masses of gypsum; violently effervescent; very strongly alkaline (pH 9.6).

Type location: Elko County, Nevada; approximately 2 miles east of Montello; about 2,200 feet north and 200 feet west of the southeast corner of section 16 T. 39 N., R. 69 E.; (41 degrees, 15 minutes, 41 seconds north latitude and 114 degrees, 09 minutes, 30 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry in July through October. The seasonal high water table is at 40 to 60 inches. It is also subject to short periods of ponding in spring.

Soil temperature: 53 to 59 degrees F.

Depth to lacustrine sediments: 40 to 60 inches.

Control section:

Clay content--25 to 35 percent.

Calcium carbonate equivalent--10 to 30 percent.

Other features--10 to 30 percent durinodes occur below 40 inches in some pedons.

A horizon:

Hue--10YR or 2.5YR.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

C and Ck horizons:

Hue--10YR or 2.5YR.

Value--7 or 8 dry

Chroma--2 or 3.

Texture--Silt loam or silty clay loam with less than 15 percent, fine or coarser sands.

Structure--Very thin or thin platy or it is massive.

Cy horizons:

Hue--10YR or 2.5YR.

Value--7 or 8 dry.

Chroma--2 or 3.

Texture--Stratified silty clay loam to silty clay with thin to thick lenses of loamy fine sand common in most pedons.

Structure--Platy or is massive.

Mottles--Few to many, distinct or prominent.

Izar Series

The Izar series consists very shallow and of shallow, somewhat excessively drained soils that formed in residuum and colluvium derived from mixed rocks. Izar soils are on hills pediments. Slopes are 2 to 50 percent. The mean annual precipitation is about 9 inches, and the mean annual temperature is about 46 degrees F.

Taxonomic class: Loamy-skeletal, mixed (calcareous), mesic Lithic Xeric Torriorthents

Typical pedon: Izar very gravelly loam, 4 to 15 percent slopes, is located in an area of map unit 685. (Colors are for dry soil unless otherwise noted.) The surface is partially covered with 60 percent pebbles.

A1--0 to 1 inch; light brownish gray (2.5Y 6/2) very gravelly loam, dark grayish brown (2.5Y 4/2) moist; moderate thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; many very fine interstitial, common very fine, and fine vesicular pores; 35 percent pebbles; slightly effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.

A2--1 to 5 inches; light brownish gray (2.5Y 6/2) very gravelly loam, dark grayish brown (2.5Y 4/2) moist; moderate fine granular structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; many very fine interstitial pores; 35 percent pebbles; slightly effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.

Bk1--5 to 8 inches; light brownish gray (2.5Y 6/2) very gravelly loam, dark grayish brown (2.5Y

4/2) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, common fine and few medium roots; many very fine interstitial pores; common very thin lime coats on the undersides of pebbles; 50 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.

Bk2--8 to 11 inches; pale yellow (2.5Y 7/4) very gravelly loam, light olive brown (2.5Y 5/4) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, common fine and few medium roots; many very fine interstitial pores; common very thin lime coats on the undersides of pebbles; 50 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

R--11 inches; hard, fractured tufts with lime and silica coats in fractures.

Type location: Elko County, Nevada; approximately 31 miles north of Wells about 6.5 miles northwest of Wilkins and 2 miles west of U.S. Hwy 93 in an unsectioned area of T. 42 N., R. 63 E.; (41 degrees, 30 minutes, 09 seconds north latitude and 114 degrees, 47 minutes, 54 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist late fall through spring, dry mid-July through October.

Soil temperature: 47 to 52 degrees F.

Depth to bedrock: 7 to 14 inches.

Control section:

Clay content--18 to 25 percent.

Reaction--Slightly alkaline or moderately alkaline.

Calcium carbonate equivalent--5 to 35 percent.

Other features--Commonly has silica and lime pan fragments covering up to 75 percent of the surface area.

Rock fragments--40 to 75 percent, mainly pebbles.

A horizons:

Hue--2.5Y or 10YR.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Bk horizons:

Hue--2.5Y or 10YR.

Value--6 through 8 dry, 4 or 5 moist.

Chroma--2 through 4.

Texture--Very gravelly loam, extremely gravelly loam, very gravelly sandy loam.

Lime coats--None to common on undersides of pebbles.

Izod Series

The Izod series consists of very shallow and shallow, somewhat excessively drained soils that formed in residuum and colluvium derived from limestone and dolomite. Izod soils are on hills. Slopes are 15 to 50 percent. The mean annual precipitation is about 9 inches, and the mean annual temperature is about 46 degrees F.

Taxonomic class: Loamy-skeletal, carbonatic, mesic Lithic Xeric Torriorthents

Typical pedon: Izod very gravelly loam, 15 to 50 percent slopes, is located in an area of map unit 961. (Colors are for dry soil unless otherwise noted). The soil surface is partially covered with 50 percent pebbles.

A--0 to 2 inches; light gray (10YR 7/2) very gravelly loam, brown (10YR 5/3) moist; moderate thick and very thick platy structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine, fine, few medium, and coarse roots; many very fine and fine vesicular, few very fine and fine tubular pores; 20 percent fine subangular blocky rock structure; 50 percent pebbles and 5 percent cobbles; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

C1--2 to 5 inches; pale brown (10YR 6/3) very gravelly loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, few medium, and coarse roots; few very fine tubular pores; 20 percent subangular blocky rock structure; 50 percent pebbles and 5 percent cobbles; violently effervescent; moderately alkaline (pH 8.2); clear smooth boundary.

C2--5 to 10 inches; pale brown (10YR 6/3) very gravelly loam, yellowish brown (10YR 5/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, few medium, and coarse roots; few very fine tubular pores; 20

percent subangular blocky rock structure; 50 percent pebbles and 5 percent cobbles; up to 50 percent of undersides of rock fragments have thin lime pendants; violently effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

R--10 inches; fractured limestone.

Type location: Elko County, Nevada; approximately 23 miles southwest of Jackpot in the O'Neil Basin; about 2,000 feet north and 2,000 feet east of the southwest corner of section 25, T. 44 N., R. 61 E.; (41 degrees, 40 minutes, 32 seconds north latitude and 115 degrees, 01 minutes, 20 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist late fall through early spring, dry June through October.

Soil temperature: 47 to 50 degrees F.

Depth to bedrock: 6 to 14 inches.

Control section:

Clay content--18 to 25 percent.

Reaction--Slightly alkaline or moderately alkaline.

Calcium carbonate equivalent--50 to 60 percent.

Other features--Commonly has silica and lime laminae covering up to 75 percent of the bedrock surface area.

Rock fragments--40 to 75 percent, mainly pebbles.

A horizon:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Effervescence--Strongly effervescent or violently effervescent.

C horizons:

Value--6 through 8 dry, 4 or 5 moist.

Chroma--2 through 4.

Structure--Weak or moderate subangular blocky or the horizon is massive.

Texture--Very gravelly loam, very gravelly silt loam, extremely gravelly silt loam.

Jackpot Series

The Jackpot series consists of shallow, well drained soils that formed in residuum and

colluvium derived from tuffaceous rocks. Jackpot soils are on pediments, and hills. Slopes are 4 to 15 percent. Mean annual precipitation is about 9 inches and mean annual temperature is about 47 degrees F.

Taxonomic class: Ashy, nonacid, mesic, shallow Xeric Torriorthents

Typical pedon: Jackpot sandy loam, 4 to 15 percent slopes, is located in an area of map unit 138. (Colors are for dry soil unless otherwise noted.)

A--0 to 4 inches; brown (10YR 5/3) sandy loam, brown (10YR 4/3) moist; weak thick platy structure; soft, very friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; 10 percent pebbles; slightly alkaline (pH 7.8); clear smooth boundary.

Bw--4 to 11 inches; pale brown (10YR 6/3) sandy loam, brown (10YR 4/3) moist; weak moderate subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; many very fine interstitial pores; 5 percent pebbles; slightly alkaline (pH 7.8); abrupt wavy boundary.

Cr--11 inches; soft ashy tuff.

Type location: Elko County, Nevada; approximately 10 miles south of Jackpot; about 1,500 feet west and 2,000 feet north of the southeast corner of section 28, T. 46 N., R. 64 E.; (41 degrees, 50 minutes, 31 seconds north latitude and 114 degrees, 43 minutes, 11 seconds west longitude.)

Range in Characteristics:

Soil moisture: Dry from June through October, but are moist in winter and spring.

Soil temperature: 47 to 50 degrees F.

Depth to bedrock: 10 to 20 inches.

Control section:

Percent clay--5 to 10 percent.

Volcanic ash--75 to 90 percent.

Reaction--Neutral or slightly alkaline.

Rock fragments--0 to 15 percent.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Bw horizon:

Value--6 or 7 dry, 4 or 5 moist.
 Chroma--3 or 4.

Jericho Series

The Jericho series consists of shallow to a indurated duripan, well drained soils that formed in alluvium derived from mixed rocks. Jericho soils are on fan remnants. Slopes are 2 to 15 percent. Mean annual precipitation is about 9 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy-skeletal, mixed, mesic, shallow Xerollic Durorthids

Typical pedon: Jericho gravelly sandy loam, 2 to 8 percent slopes, is located in an area of map unit 764. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 15 percent pebbles.

A--0 to 4 inches; light brownish gray (10YR 6/2) gravelly sandy loam, brown (10YR 5/3) moist; strong thin platy structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; many very fine, fine, and few medium vesicular pores; 20 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Bw--4 to 7 inches pale brown (10YR 6/3) gravelly fine sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine and medium roots; many fine and few medium interstitial pores; thin lime coats on undersides of pebbles; 25 percent pebbles; violently effervescent; strongly alkaline (pH 8.8); clear wavy boundary.

Bqk--7 to 17 inches; very pale brown (10YR 7/3) very gravelly fine sandy loam, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; few very fine and fine interstitial pores; 30 percent pebbles and 10 percent cobbles; 10 percent discontinuous strong silica and lime cementation; thin lime coats on undersides of rock fragments; violently effervescent; strongly alkaline (pH 9.0); abrupt wavy boundary.

Bqkm--17 to 31 inches; white (10YR 8/1)

indurated duripan, very pale brown(10YR 7/3) moist; massive; very rigid; continuous 2 to 5 millimeter thick horizontal silica laminae at upper surface and in horizontal bands throughout horizon; violently effervescent; abrupt wavy boundary.

2Cqk--31 to 60 inches; very pale brown (10YR 7/3) gravelly sandy loam, brown (10YR 5/3) moist; massive; soft, very friable; nonsticky and nonplastic; many very fine interstitial pores; 25 percent discontinuous strong silica and lime cementation; thin lime coats on undersides of pebbles; 20 percent pebbles; violently effervescent; strongly alkaline (pH 8.8).

Type location: Elko County, Nevada; approximately 10 miles southeast of Montello; about 500 feet west and 500 feet north of the southeast corner of section 13, T. 38 N., R. 69 E.; (41 degrees, 10 minutes, 10 seconds north latitude and 114 degrees, 06 minutes, 08 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from late June through late October.

Soil temperature: 48 to 52 degrees F.

A & Bw horizons thickness: 5 to 10 inches.

Depth to indurated duripan: 14 to 20 inches.

Control section:

Clay content--10 to 18 percent.

Rock fragments--35 to 50 percent, mainly pebbles but may also have some cobbles and stones. About 1/4 to 3/4 of rock fragments are duripan fragments.

Reaction--Moderately alkaline or strongly alkaline.

A horizon:

Value--5 or 6 dry, 3 through 5 moist.

Chroma--2 or 3. (when mixed, the color in the upper 7 inches averages a value lighter than 3.5 when moist and 5.5 when dry, and chroma greater than 3.5 when moist.

Bw horizon:

Value--5 through 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Bqk or Bk horizon:

Value--6 through 8 dry, 5 through 7 moist.

Chroma--2 through 4.

Bqkm horizon:

Value--7 or 8 dry, 6 or 7 moist.

Chroma--1 through 3. It contains a continuous laminaer cap. It is indurated by silica and lime cementation with an average lateral distance between fractures of less than 4 inches.

Kawich Series

The Kawich series consists of deep and very deep, excessively drained soils that formed in eolian sand. Kawich soils are on stabilized dunes and sand sheets. Slopes are 2 to 50 percent. The mean annual precipitation is about 6 inches and the mean annual temperature is about 53 degrees F.

Taxonomic class: Mixed, mesic Typic Torripsamments

Typical pedon: Kawich fine sand, 8 to 30 percent slopes, is located in an area of map unit 2060. (Colors are for dry soil unless otherwise noted.)

- A--0 to 4 inches; light brownish gray (10YR 6/2) fine sand, dark grayish brown (10YR 4/2) moist; single grain; loose, nonsticky and nonplastic; many very fine, fine, and few medium roots; many very fine interstitial pores; strongly effervescent; strongly alkaline (pH 8.8); abrupt wavy boundary.
- C1--4 to 11 inches; light brownish gray (10YR 6/2) fine sand, dark yellowish brown (10YR 4/4) moist; massive parting to single grain; soft, very friable, nonsticky and nonplastic; common very fine, fine, few medium, and coarse roots; many very fine interstitial pores; strongly effervescent; strongly alkaline (pH 8.8); clear wavy boundary.
- C2--11 to 43 inches; light brownish gray (10YR 6/2) fine sand, dark grayish brown (10YR 4/2) moist; single grain; loose, nonsticky and nonplastic; common very fine, fine, medium and coarse roots; many very fine interstitial pores; strongly effervescent; moderately alkaline (pH 8.4); gradual wavy boundary.
- C3--43 to 60 inches; light brownish gray (10YR 6/2) fine sand, dark grayish brown (10YR 4/2) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; many very fine interstitial pores; strongly effervescent; moderately alkaline (pH 8.4).

Type location: Elko County, Nevada; approximately 2 miles south of Dake Reservoir; about 2,250 feet west and 1,150 feet south of the northeast corner of section 30, T. 40 N., R. 70 E.; (41 degrees, 19 minutes, 32 seconds north latitude and 114 degrees, 05 minutes, 16 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and early spring, dry late May through early November.

Soil temperature: 54 to 59 degrees F.

Depth to unconformable playa: 40 to over 120 inches.

Effervescence: Slightly effervescent to violently effervescent.

Soil reaction: Moderately alkaline to very strongly alkaline.

Control section:

Texture--Averages fine sand, but may contain strata of sand or loamy fine sand.

Color of soil profile--Hue--10YR or 7.5YR.

Value--5 through 8 dry; 4 through 6 moist. Chroma--2 through 4.

Other features--Contains significant amounts of pyroclastic material.

Kelk Series

The Kelk series consists of very deep, well drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. The Kelk soils are on inset fans, fan skirts and stream terraces. Slopes are 0 to 8 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is 48 degrees F.

Taxonomic class: Fine-silty, mixed, mesic Durixerollic Camborthids

Typical pedon: Kelk silt loam, rarely flooded, 0 to 2 percent slopes, is located in an area of map unit 430. (Colors are for dry soil unless otherwise noted.)

A1--0 to 6 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 3/3) moist; weak very thin platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine and

few fine roots; few very fine interstitial pores; neutral (pH 7.0); abrupt smooth boundary
 Bw--6 to 12 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; few very fine and fine roots; few very fine interstitial pores; moderately alkaline (pH 8.0); clear smooth boundary.

Bqk1--12 to 28 inches; light yellowish brown (10YR 6/4) silt loam, yellowish brown (10YR 5/4) moist; weak medium subangular blocky structure; very hard, firm, and brittle, slightly sticky and slightly plastic; many very fine tubular and interstitial pores; 40 percent 5 to 20 millimeter, hard, firm durinodes; continuous brittle matrix; slightly effervescent; moderately alkaline (pH 8.0); clear smooth boundary.

Bqk2--28 to 38 inches; pale brown (10YR 6/3) silt loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few every fine roots; common very fine interstitial pores; strongly effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Bqk3--38 to 50 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; massive; very hard, firm, nonsticky and nonplastic; common very fine interstitial pores; 40 percent 5 to 20 millimeter, hard, firm durinodes; continuous brittle matrix; strongly effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Bqk4--50 to 63 inches; light yellowish brown (10YR 6/4) silt loam, yellowish brown (10YR 5/4) moist; massive; slightly hard, friable, nonsticky and nonplastic; many very fine and fine tubular pores; 20 percent discontinuous brittle matrix; slightly effervescent; strongly alkaline (pH 8.8).

Type location: Elko County, Nevada; approximately 10 miles northwest of Wells; about 1,500 feet east of the northwest corner of section 3, T. 38 N., R. 61 E.; (41 degrees, 12 minutes, 58 seconds north latitude and 115 degrees, 04 minutes, 28 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the winter and spring, dry from early June through October.

Soil temperature: 47 to 52 degrees F.

Depth to base of Bw horizon: 12 to 18 inches.

Depth to continuous weak brittle matrix: 12 to 35 inches.

Depth to carbonates: 12 to 35 inches.

Control section:

Clay content--18 to 25 percent.

Other features--These soils are normally slightly or moderately salt affected below 24 to 48 inches.

A horizon:

Hue--10YR or 2.5Y.

Value--5 or 6 dry.

Chroma--2 or 3.

Reaction--Neutral to moderately alkaline.

Effervescence--Noneffervescent or slightly effervescent.

Bw horizon:

Value--6 or 7 dry, 3 or 4 moist.

Chroma--2 or 3.

Structure--Subangular blocky or prismatic or it is massive.

Reaction--Neutral to moderately alkaline, it is strongly alkaline when affected by salts and sodium.

Effervescence--Noneffervescent or slightly effervescent.

Other features--There are 10 to 20 percent weak durinodes near the lower horizon boundary in some pedons.

Bq and Bqk horizons:

Value--6 through 8 dry, and 3 through 6 moist.

Chroma--2 through 4.

Texture--Dominantly silt loam with thin strata of silty clay loam common in some pedons below 30 inches.

Reaction--Neutral to strongly alkaline, increasing with depth.

Effervescence--Slightly effervescent to violently effervescent.

Cementation--Subhorizons not continuously silica cemented contain 30 to 90 percent durinodes or are 20 to 50 percent discontinuous weakly silica cemented.

Other features--Some pedons lack relict mottles in the lower part of the Bqk horizons. Some pedons have lenses of 5 to 15 percent pebbles in some Bqk subhorizon or extremely gravelly substrata below 42 inches. Some pedons have silty clay loam 2Bk horizons below 39 inches.

Keman Series

The Keman series consists of very deep, well drained soils that formed in colluvium derived from pyroclastic and volcanic rocks. Keman soils are on mountains. Slopes are 4 to 50 percent. The mean annual precipitation is about 20 inches, and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy-skeletal, mixed Argic Pachic Cryoborolls

Typical pedon: Keman gravelly loam, 4 to 15 percent slopes, is located in area of map unit 747. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 15 percent pebbles and 2 percent stones.

A--0 to 5 inches; very dark grayish brown (10YR 3/2) gravelly loam, very dark brown (10YR 2/2) moist; weak very fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine tubular pores; 20 percent pebbles; slightly acid (pH 6.4); clear smooth boundary.

AB--5 to 15 inches; very dark grayish brown (10YR 3/2) gravelly loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and few fine and medium roots; many very fine tubular pores; 30 percent pebbles; slightly acid (pH 6.5); clear wavy boundary.

Bt1--15 to 31 inches; dark grayish brown (10YR 4/2) very gravelly loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and few fine and medium roots; common very fine tubular pores; common thin clay films on faces of peds, lining pores and bridging mineral grains; 40 percent pebbles; slightly acid (pH 6.5); clear wavy boundary.

Bt2--31 to 38 inches; dark yellowish brown (10YR 4/4) very gravelly loam, dark yellowish brown (10YR 3/4) moist; weak coarse subangular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; few very fine roots; common very fine and fine tubular pores; many thin clay films on faces of peds, lining pores and bridging mineral grains; 50

percent pebbles and 5 percent cobbles; slightly acid (pH 6.5); clear wavy boundary.
Bt3--38 to 60 inches; yellowish brown (10YR 5/4) extremely gravelly clay loam, dark yellowish brown (10YR 4/4) moist; weak coarse subangular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; few very fine roots; many very fine and common fine tubular pores; many thin and moderately thick clay films on faces of peds, lining pores and bridging mineral grains; 55 percent pebbles and 10 percent cobbles; slightly acid (pH 6.5)

Type location: Elko County, Nevada; about 500 feet east and 750 feet north of the southeast corner of section 2, T. 47 N., R. 62 E.; (41 degrees, 59 minutes, 10 seconds north latitude and 114 degrees, 55 minutes, 40 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; dry late July through September. Moist in winter and spring.

Soil temperature: 39 to 42 degrees F.

Average summer soil temperature: 55 to 58 degrees F.

Mollic epipedon thickness: 30 to 50 inches.

Base saturation in the upper 40 inches: 50 to 70 percent.

Control section:

Clay content--18 to 24 percent.

Rock fragments--40 to 70 percent.

A horizon:

Value--3 or 4 dry.

Chroma--1 through 3.

Bt1 horizon:

Value--3 through 5 dry, 2 or 3 moist.

Chroma--1 through 3.

Rock fragments--40 to 70 percent, 0 to 10 percent cobbles.

Clay films--Few or common on faces of peds and in pores.

Bt2 horizon:

Value--4 through 6 dry, 3 or 4 moist.

Chroma--3 or 4.

Texture--Very gravelly loam or extremely gravelly clay loam.

Rock fragments--40 to 65 percent.

Clay films--Few to many thin or moderately thick on faces of peds and in pores.

Kleckner Series

The Kleckner series consists of very deep, well drained soils that formed in alluvium derived from mixed rocks. Kleckner soils are on fan remnants and hills. Slopes are 2 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, frigid Aridic Argixerolls

Typical pedon: Kleckner silt loam, 2 to 8 percent slopes, is located in an area of map unit 3100. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 10 percent pebbles.

A1--0 to 2 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate very thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine and fine interstitial pores; 10 percent pebbles; neutral (pH 7.2); abrupt smooth boundary.

A2--2 to 7 inches; grayish brown (10YR 5/2) silty clay loam, very dark grayish brown (10YR 3/2) moist; weak medium platy structure; slightly hard, very friable, moderately sticky and moderately plastic; common very fine and medium roots; common very fine and fine interstitial pores; 5 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt1--7 to 11 inches; brown (10YR 5/3) gravelly clay, dark brown (10YR 3/3) moist; weak medium prismatic structure parting to moderate fine angular blocky; hard, friable, moderately sticky and moderately plastic; common very fine and medium roots; common very fine and fine interstitial pores; few thin clay films on faces of peds; 15 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

2Bt2--11 to 19 inches; brown (10YR 5/3) very cobbly clay, dark brown (10YR 4/3) moist; strong medium prismatic structure; very hard, very firm, very sticky and very plastic; common very fine and medium expd roots; few very

fine tubular pores; continuous pressure faces; 10 percent pebbles and 25 percent cobbles; neutral (pH 7.0); clear smooth boundary.

2Bt3--19 to 33 inches; yellowish brown (10YR 5/4) very cobbly clay, dark yellowish brown (10YR 4/4) moist; strong medium prismatic structure; very hard, very firm, very sticky and very plastic; few very fine and medium expd roots; few very fine tubular pores; continuous pressure faces; 10 percent pebbles, 25 percent cobbles and 5 percent stones; neutral (pH 7.2); gradual wavy boundary.

2Bt4--33 to 42 inches; yellowish brown (10YR 5/4) very cobbly clay, dark yellowish brown (10YR 4/4) moist; weak medium angular blocky structure; hard, firm, very sticky and very plastic; few very fine and medium expd roots; common very fine interstitial pores; common moderately thick clay films on faces of peds; 20 percent pebbles, 25 percent cobbles and 2 percent stones; slightly alkaline (pH 7.6); clear wavy boundary.

3Bqk--42 to 60 inches; very pale brown (10YR 7/4) extremely gravelly sandy loam, yellowish brown (10YR 5/6) moist; massive; hard, firm, nonsticky and nonplastic; thin lime coats on undersides of rock fragments; many large segregated lime seams; 50 percent pebbles and 10 percent cobbles; continuous brittle matrix; violently effervescent; moderately alkaline (pH 8.2).

Type location: Elko County, Nevada; approximately 13 miles east of Wells near the base of Wells Peak; about 1,900 feet west and 1,750 feet south of the assumed northeast corner of section 22, T. 38 N., R. 63 E.; (41 degrees, 09 minutes, 57 seconds north latitude and 114 degrees, 50 minutes, 09 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring, dry early July through October.

Soil temperature: 44 to 47 degrees F.

Thickness of mollic epipedon: 10 to 16 inches. It includes the upper part of the argillic horizon.

Depth to Bq horizon: 40 to 60 inches.

Control section:

Clay content--35 to 50 percent.

Rock fragments--35 to 60 percent; mainly pebbles or cobbles.

A horizons:

Value--2 or 3 moist.

Chroma--2 or 3.

Reaction--Neutral or slightly alkaline.

Bt horizons:

Hue--7.5YR or 10YR.

Value--5 through 7 dry, 3 through 6 moist.

Darker values are common only in the upper subhorizons.

Chroma--3 through 6.

Texture--Very cobbly clay, very cobbly clay loam or very gravelly clay in the upper part with thin subhorizons that are gravelly clay, and gravelly clay loam, very gravelly clay or very cobbly clay in the lower part. Loam is common in some pedons at depths below 35 inches.

Reaction--Neutral or slightly alkaline.

Bq horizon:

Cementation--Contains 20 to 40 percent durinodes or has a continuous brittle matrix.

Reaction--Slightly alkaline or moderately alkaline.

Other features--Some pedons have lime in the Bq subhorizons.

Kram Series

The Kram series consists of very shallow and shallow somewhat excessively drained soils formed in residuum derived from limestone and dolomite. These soils are on hills and mountains. Slopes are 4 to 50 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Loamy-skeletal, carbonatic, mesic Lithic Xeric Torriorthents

Typical pedon: Kram very gravelly loam, 15 to 50 percent slopes, is located in an area of map unit 3012. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 60 percent pebbles and 5 percent cobbles.

A--0 to 3 inches; light brownish gray (10YR 6/2) very gravelly loam, dark grayish brown (10YR 4/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; few very fine, fine and medium

roots; common very fine and fine vesicular and tubular pores; 45 percent pebbles and 5 percent cobbles; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

C1--3 to 6 inches; pale brown (10YR 6/3) very gravelly loam, yellowish brown (10YR 5/4) moist; moderate fine subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common very fine, fine and medium roots; common very fine and fine tubular pores; common thin to moderately thick lime pendants on the undersides of rock fragments; 45 percent pebbles and 5 percent cobbles; violently effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

C2--6 to 9 inches; pale brown (10YR 6/3) very gravelly loam, yellowish brown (10YR 5/4) moist; massive; slightly hard, very friable, nonsticky and nonplastic; common very fine, fine, medium, and few coarse roots; few very fine tubular pores; many moderately thick to thick lime pendants on undersides of rock fragments; 55 percent pebbles and 5 percent cobbles; violently effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

R--9 inches; highly fractured, limestone with few very fine to coarse roots in fractures.

Type location: Elko County, Nevada; approximately 19 miles north of Montello; about 2,900 north of the southwest corner of the Crittenden Reservoir earthen dam; (41 degrees, 31 minutes, 57 seconds north latitude and 114 degrees, 10 minutes, 30 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry mid June through October.

Soil temperature: 49 to 52 degrees F.

Depth to bedrock: 8 to 14 inches.

Control section:

Clay content--8 to 18 percent.

Rock fragments--40 to 50 percent pebbles; 5 to 10 percent cobbles and Reaction--Moderately alkaline or strongly alkaline. Calcium carbonate equivalent of whole soil (less than 20 millimeters)--40 to 50 percent stones, when averaged.

A horizon:

Value--4 through 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Rock fragments--35 to 45 percent pebbles, 5 to 10 percent cobbles and stones.

Effervescence--Slightly effervescent to violently effervescent.

C horizons:

Hue--10YR or 2.5Y.

Value--6 or 7 dry; 3 through 5 moist.

Chroma--2 through 4.

Texture--Very gravelly very fine sandy loam or very gravelly loam.

Rock fragments--45 to 55 percent pebbles, 5 to 10 percent cobbles and stones.

Effervescence--Strongly effervescent or violently effervescent.

Kzin Series

The Kzin series consists of very shallow and shallow well drained soils that formed in residuum derived from sedimentary rocks. The Kzin soils are on hills, pediments, and lower parts of mountains. Slopes are 8 to 50 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Loamy-skeletal, mixed (calcareous), mesic shallow Xeric Torriorthents

Typical pedon: Kzin very gravelly loam, 8 to 30 percent slopes, is located in an area of map unit 1060. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 75 percent pebbles and 2 percent with stones.

A--0 to 3 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak very fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine roots; common very fine interstitial pores; thin lime coats on rock fragments; 35 percent pebbles, 2 percent cobbles, and 2 percent stones, violently effervescent; strongly alkaline (pH 8.5); abrupt wavy boundary.

Bk--3 to 8 inches; brown (10YR 5/3) very gravelly loam, dark brown (10YR 4/3) moist; massive; slightly hard, very friable, nonsticky and nonplastic; many very fine, common fine and few medium roots; common very fine and few fine interstitial pores; thin lime coats on rock

fragments; common thin lime pendants on undersides of rock fragments; 45 percent pebbles and 5 percent cobbles; violently effervescent, strongly alkaline (pH 8.5), clear wavy boundary.

Cr--8 to 20 inches; light gray (10YR 7/2) soft fractured pudding stone with approximately 30 percent pebbles of less than 1 inch in diameter in the matrix, brown (10YR 5/3) moist; rock structure; few very fine, fine medium and coarse roots in fractures; thin lime coats along fractures.

Type location: Elko County, Nevada; approximately 8 1/2 miles southeast of Montello, about 1,500 feet south and 2,815 feet west of the northeast corner of section 4 T. 38 N., and R. 70 E.; (41 degrees, 12 minutes, 32 seconds north latitude and 114 degrees, 03 minutes, 05 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry mid-June through late October.

Soil temperature: 47 to 52 degrees F.

Depth to paralithic contact: 4 to 12 inches.

Control section:

Percent clay--15 to 25 percent.

Reaction--Moderately alkaline or strongly alkaline.

Calcium carbonate equivalent--15 to 30 percent.

Other features--Eroded phases are recognized.

Rock fragments--35 to 50 percent, mainly pebbles.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Bk horizon:

Value--5 or 6 dry, 4 or 5 moist.

Chroma--2 or 3.

Texture--Very gravelly loam, very gravelly sandy loam.

Structure--Subangular blocky or is massive.

Lerrow Series

The Lerrow series consists of moderately deep, well drained soils that formed in residuum and

colluvium derived from mixed rocks. Lerrow soils are on hills. Slopes are 4 to 50 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid Aridic Argixerolls

Typical pedon: Lerrow gravelly loam, 30 to 50 percent slopes, is located in an area of map unit 060. (Colors are for dry soil unless otherwise noted.) The surface is partially covered with 30 percent pebbles.

A1--0 to 3 inches; grayish brown (10YR 5/2) gravelly loam, very dark brown (10YR 2/2) moist; moderate thin platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine roots; few very fine interstitial pores; 25 percent pebbles; neutral (pH 6.8); clear smooth boundary.

A2--3 to 10 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, few fine, and medium roots; many very fine interstitial pores; 25 percent pebbles; neutral (pH 7.0); clear smooth boundary.

Bt1--10 to 16 inches; brown (10YR 5/3) gravelly clay loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; few fine and medium roots; many very fine tubular pores; common thin clay films on faces of peds and lining pores; 30 percent pebbles; neutral (pH 7.0); abrupt smooth boundary.

Bt2--16 to 24 inches; brown (10YR 5/3) gravelly clay, dark brown (10YR 4/3) moist; moderate medium prismatic structure; very hard, firm, very sticky and very plastic; common very fine and few fine tubular pores; many moderately thick clay films on faces of peds and lining pores; 20 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.8); clear smooth boundary.

2Cr--24 to 40 inches; saprolitic tuff.

Type location: Elko County, Nevada approximately 9 miles north of Wells about 2,500 feet west of the northeast corner of section 28, T. 39 N., R. 62 E.; (41 degrees, 14 minutes, 02 seconds

north latitude and 114 degrees, 58 minutes, 19 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist late fall through spring, dry late June through October.

Soil temperature: 45 to 47 degrees F.

Mollic epipedon thickness: 10 to 17 inches, includes the upper argillic horizon.

Depth to paralithic contact: 20 to 40 inches.

Control section:

Clay content--35 to 50 percent.

Reaction--Neutral to slightly alkaline increasing with depth.

Rock fragments--15 to 35 percent, mainly cobbles and pebbles.

A horizons:

Value--5 or 6 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt1 horizon:

Chroma--2 or 3.

Texture--Clay loam or gravelly clay loam.

Clay content--30 to 40 percent

Rock fragments--10 to 35 percent, mainly pebbles.

Structure--Weak or moderate subangular blocky.

Bt2 horizons:

Chroma--3 or 4 moist.

Clay content--40 to 55 percent.

Texture--Clay, gravelly clay or cobbly clay.

Rock fragments--10 to 20 percent pebbles, 0 to 5 percent stones and 5 to 15 percent cobbles.

Structure--Weak to strong, fine to coarse prismatic.

Cr horizon:

Effervescence--Noneffervescent to slightly effervescent.

Lerrow Variant

Lerrow variant consists of very deep, well drained soils formed in alluvium derived from mixed rocks. Lerrow variant soils are on fan remnants. Slopes range from 4 to 15 percent. Mean annual

precipitation is about 12 inches. Mean annual temperature is about 43 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid Calcic Pachic Argixerolls

Typical pedon: Lerrow variant gravelly loam, 4 to 15 percent slopes, is located in an area of map unit 3080. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 10 percent pebbles.

A--0 to 4 inches; very dark grayish brown (10YR 3/2) gravelly loam, black (10YR 2/1) moist; moderate thin platy structure parting to strong fine granular; soft, very friable, slightly sticky and slightly plastic; many very fine, fine and medium inped roots; many very fine interstitial pores; 15 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

Bt1--4 to 15 inches; dark grayish brown (10YR 4/2) gravelly clay, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure parting to strong fine granular; slightly hard, friable, very sticky and very plastic; many very fine, fine, medium and coarse inped roots; many very fine and few fine tubular pores; few thin clay films on faces of peds; 20 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt2--15 to 22 inches; brown (10YR 5/3) gravelly clay, dark brown (10YR 3/3) moist; moderate coarse angular blocky structure; very hard, firm, very sticky and very plastic; common very fine and fine, few medium and coarse exped roots; many very fine and few fine tubular pores; many thin clay films on faces of peds and lining pores; 30 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt3--22 to 27 inches; yellowish brown (10YR 5/4) gravelly clay, dark yellowish brown (10YR 4/4) moist; moderate coarse prismatic structure; very hard, firm, very sticky and very plastic; few very fine, fine, and medium exped roots; many very fine and few fine tubular pores; many pressure faces; few moderately thick clay films lining pores; 30 percent pebbles; neutral (pH 7.2); abrupt wavy boundary.

Btk1--27 to 31 inches; very pale brown (10YR 7/3) gravelly clay, brown (10YR 5/3) moist; weak coarse prismatic structure parting to moderate medium subangular blocky; hard, friable, very sticky and very plastic; few very fine, fine, and medium inped roots; many very fine and few fine tubular pores; few stress surfaces;

common fine rounded lime soft masses with lime coats on undersides of pebbles; 30 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

Btk2--31 to 51 inches; light yellowish brown (2.5Y 6/4) gravelly clay, light olive brown (2.5Y 5/4) moist; weak medium subangular blocky structure; hard, friable, very sticky and very plastic; few very fine, fine and medium inped roots; many very fine and few fine tubular pores; few stress surfaces; common fine, irregular soft lime filaments and many medium rounded lime soft masses with lime coats on undersides of pebbles; 30 percent pebbles; strongly effervescent in lime seams; moderately alkaline (pH 8.2); gradual wavy boundary.

2Bk--51 to 61 inches; light brownish gray (2.5Y 6/2) extremely gravelly sandy loam, light yellowish brown (2.5Y 6/4) moist; massive; hard, friable, slightly sticky and slightly plastic; few very fine roots; common very fine tubular pores; many medium rounded lime soft masses and lime filaments, common lime coats on rock fragments; 55 percent pebbles, 10 percent cobbles and 5 percent stones; violently effervescent; moderately alkaline (pH 8.4).

Type location: Elko County, Nevada; approximately 28 miles north of Wells; about 2,000 feet east and 750 feet south of the northwest corner of section 34, T. 42 N., R. 62 E.; (41 degrees, 29 minutes, 29 seconds north latitude and 114 degrees, 56 minutes, 37 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; dry from about mid-July to October.

Soil temperature: 44 to 46 degrees F.

Mollic epipedon thickness: 20 to 25 inches, includes the upper part of the argillic horizon.

Depth to argillic horizon: 2 to 5 inches.

Depth to calcic horizon: 24 to 30 inches.

Control section:

Clay content--45 to 55 percent.

Rock fragments--5 to 30 percent, mainly pebbles.

A horizon:

Value--3 or 4 dry, 2 or 3 moist.

Chroma--1 through 3.

Structure--Platy, granular or subangular blocky.

Bt horizons:

Value--4 or 5 dry, 3 or 4 moist.
 Chroma--2 through 4.
 Textures--Gravelly clay or clay.
 Structure--Angular blocky, subangular blocky or prismatic.

Btk horizons:

Hue--10YR or 2.5Y.
 Value--6 or 7 dry, 4 or 5 moist.
 Chroma--3 or 4.
 Calcium carbonate equivalent--15 to 25 percent.
 Textures--Gravelly clay or clay.

Bk horizon:

Value--6 or 7 dry, 4 through 6 moist.
 Calcium carbonate equivalent--20 to 40 percent.

Loncan Series

The Loncan series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from mixed rocks. Loncan soils are on mountains. Slopes are 15 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual air temperature is 42 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Aridic Haploxerolls

Typical pedon: Loncan very gravelly loam, 15 to 50 percent slopes, is located in an area of map unit 490. (Colors are for dry soil unless otherwise noted.)

A1--0 to 7 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common fine and medium roots; common very fine and fine tubular pores; 35 percent pebbles; neutral (pH 7.2); clear wavy boundary.

A2--7 to 16 inches; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; common medium and fine tubular pores; 35

percent pebbles and 5 percent cobbles; neutral (pH 7.2); clear wavy boundary.

C1--16 to 29 inches; pale brown (10YR 6/3) very gravelly loam, dark brown (10YR 4/3) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; common fine and medium tubular pores; 45 percent pebbles and 5 percent cobbles; neutral (pH 7.3); clear smooth boundary.

C2--29 to 37 inches; pale brown (10YR 6/3) very gravelly sandy clay loam, dark grayish brown (10YR 4/2) moist; weak medium subangular blocky structure; soft, very friable, moderately sticky and moderately plastic; common very fine and few fine roots; common fine tubular pores; 45 percent pebbles and 10 percent cobbles; neutral (pH 7.3); abrupt wavy boundary.

R--37 inches; hard tuff bedrock with thin matt of roots on surface.

Type location: Elko County, Nevada; approximately 19 miles northwest of Wells in an unsectionized area; about 1,400 feet west and 2,750 feet south of the southeast corner of section 32, T. 41 N., R. 61 E.; (41 degrees, 23 minutes, 07 seconds north latitude and 115 degrees, 05 minutes, 30 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring and dry late June through mid-October.

Soil temperature: 42 to 47 degrees F.

Mollic epipedon thickness: 10 to 17 inches.

Depth to bedrock: 21 to 38 inches.

Control section:

Clay content--18 to 27 percent.

Rock fragments--Averages 50 to 70 percent pebbles and cobbles with very few stones.

A horizons:

Value--4 or 5 dry.

Chroma--2 or 3.

C horizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Texture--Very gravelly loam, extremely cobbly loam, very gravelly sandy clay loam, or extremely gravelly loam.

Rock fragments--40 to 70 percent pebbles and cobbles.

Loomis Series

The Loomis series consists of very shallow and shallow, well drained soils that formed in residuum and colluvium derived from mixed rocks. The Loomis soils are on hills. Slopes are 4 to 30 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, mesic Lithic Xerollic Haplargids

Typical pedon: Loomis very cobbly loam, 4 to 15 percent slopes, is located in an area of map unit 790. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 35 percent pebbles, 15 percent cobbles, and 5 percent stones.

A--0 to 1 inch; pale brown (10YR 6/3) very cobbly loam, brown (10YR 4/3) moist; moderate medium and thick platy structure; soft, very friable, slightly sticky and slightly plastic; few very fine and fine roots; many very fine and fine vesicular pores; slightly effervescent; common lime pendants on undersides of rock fragments; 25 percent pebbles, 25 percent cobbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

Bt1--1 to 5 inches; brown (10YR 5/3) very cobbly clay loam, dark yellowish brown (10YR 3/4) moist; moderate fine subangular blocky structure; slightly hard, firm, very sticky and very plastic; few very fine and fine roots; few very fine and fine tubular pores; common lime pendants on underside of rock fragments; few thin clay films on faces of peds and lining pores; 20 percent pebbles, 20 percent cobbles; slightly alkaline (pH 7.6); clear wavy boundary.

Bt2--5 to 9 inches; brown (10YR 5/3) very cobbly clay, brown (10YR 4/3) moist; moderate medium angular blocky structure; slightly hard, firm, very sticky and very plastic; few very fine and fine roots; few very fine and fine tubular pores; common lime pendants on undersides of rock fragments; few thin clay films on faces of peds and lining pores; 20 percent pebbles, 20 percent cobbles; slightly alkaline (pH 7.4); abrupt wavy boundary.

R--9 inches; highly fractured basalt bedrock.

Type location: Elko County, Nevada; approximately 10 miles southwest of Contact, about 4,000

feet west of the northeast corner of section 32, T. 44 N., R. 63 E.; (41 degrees, 39 minutes, 51 seconds north latitude and 114 degrees, 52 minutes, 20 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring, dry from June through October.

Soil temperature: 47 to 52 degrees F.

Depth to bedrock: 8 to 14 inches.

Control section:

Clay content--Averages 35 to 55 percent.

Reaction--Neutral or slightly alkaline.

Rock fragments--35 to 75 percent. Up to 40 percent are cobbles.

A horizon:

Value--5 through 7 dry, 3 through 5 moist.

Chroma--2 or 3.

Bt horizons:

Value--5 or 6 dry, 3 through 5 moist.

Chroma--3 or 4.

Texture--Very cobbly or extremely cobbly clay or clay loam.

Clay content--Averages 35 to 55 percent.

Rock fragments--35 to 75 percent with up to 40 percent cobbles.

Structure--Subangular blocky or angular blocky, weak to strong prismatic.

Consistence--Soft to very hard dry, very friable to firm moist, and moderately sticky or very sticky and moderately plastic or very plastic wet.

Loray Series

The Loray series consists of very deep, somewhat excessively drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. Loray soils are on beach plains, spits, and fan skirts. Slopes are 2 to 30 percent. The mean annual precipitation is about 6 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Sandy-skeletal, mixed, mesic Typic Calciorthids

Typical pedon: Loray gravelly loam, 2 to 4 percent slopes, is located in an area of map unit 1070. (Colors are for dry soil unless otherwise noted.)

The soil surface is partially covered with 50 percent pebbles.

- A1--0 to 2 inches; light gray (10YR 7/2) gravelly loam, brown (10YR 5/3) moist; moderate thick platy structure; slightly hard, very friable, nonsticky and slightly plastic; few very fine roots; many very fine and fine interstitial pores; 25 percent pebbles; strongly effervescent; strongly alkaline (pH 8.8); abrupt smooth boundary.
- A2--2 to 6 inches; light gray (10YR 7/2) loam, brown (10YR 5/3) moist; strong very thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, few fine, and medium roots; common very fine interstitial pores; 10 percent pebbles; violently effervescent; strongly alkaline (pH 8.8); clear wavy boundary.
- Bk1--6 to 12 inches; light gray (10YR 7/2) gravelly sandy loam, brown (10YR 5/3) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine, and few medium roots; common very fine and few fine interstitial pores; common fine filaments and soft masses of lime; common thin lime coats on undersides of pebbles; 25 percent pebbles; violently effervescent; strongly alkaline (pH 8.6); clear wavy boundary.
- 2Bk2--12 to 18 inches; light gray (10YR 7/2) extremely gravelly loamy sand, brown (10YR 5/3) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; common very fine intersitital pores; 10 percent strong lime cementation; many thick lime coats on undersides of pebbles; common soft masses of lime; 70 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); abrupt irregular boundary.
- 2Bk3--18 to 23 inches; white (10YR 8/2) extremely gravelly loamy fine sand, pale brown (10YR 6/3) moist; single grain; loose, nonsticky and nonplastic; many very fine roots; many very fine interstitial pores; many thick lime coats on undersides of pebbles; common soft masses of lime; 60 percent pebbles; violently effervescent; moderately alkaline (pH 8.0); clear wavy boundary.
- 2Ck1--23 to 47 inches; white (10YR 8/2) stratified extremely gravelly sand and extremely gravelly coarse sand, pale brown (10YR 6/3) moist; single grain; loose, nonsticky and nonplastic; many very fine roots; common very fine interstitial pores; thin lime coats on undersides

of rock fragments; 70 percent pebbles and 5 percent cobbles; violently effervescent; moderately alkaline (pH 8.0); clear wavy boundary.

- 2Ck2--47 to 61 inches; light gray (10YR 7/2) extremely gravelly coarse sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; common very fine interstitial pores; thin lime coats on undersides of rock fragments; 65 percent pebbles and 15 percent cobbles; violently effervescent; moderately alkaline (pH 8.4).

Type location: Elko County, Nevada; approximately 3 miles southwest of Montello; about 500 feet south and 2,100 feet west of the northeast corner of section 36 T. 39 N., R. 68 E.; (41 degrees, 13 minutes, 48 seconds north latitude and 114 degrees, 13 minutes, 30 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry late May through early November.

Soil temperature: 53 to 59 degrees F.

Depth to calcic horizon: 4 to 18 inches.

Control section:

Clay content--Averages 0 to 8 percent.

Reaction--Moderately alkaline to strongly alkaline

Calcium carbonate equivalent--5 to 20 percent.

Soft powdery lime--5 to 20 percent lime filaments and masses.

Rock fragments--Averages 60 to 80 percent mainly pebbles with 0 to 10 percent cobbles.

A horizons:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Bk horizon:

Value--6 through 8 dry; 4 through 6 moist.

Texture--Loamy fine sand, sandy loam, fine sandy loam or loam.

Clay content--5 to 20 percent.

Rock fragments--5 to 35 percent, mainly pebbles.

2Bk horizons:

Value--6 through 8 dry, 4 through 6 moist.

Chroma--2 or 3.

Textures--Stratified extremely gravelly loamy fine sand to extremely gravelly coarse sand.
 Clay content--0 to 8 percent.
 Rock fragments--60 to 80 percent, mainly pebbles.
 Structure--Massive or single grain.
 Lime cementation--Up to 20 percent weak or strong discontinuous lime cementation is common in any subhorizon.

2Ck horizons:

Value--6 through 8 dry; 4 through 6 moist.
 Chroma--2 or 3.
 Structure--Massive or single grain.
 Consistence--Slightly hard or loose.
 Calcium carbonate equivalent--5 to 10 percent.

Luap Series

The Luap series consists of moderately deep to a strongly cemented lime hardpan, well drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. The Luap soils are on fan skirts and spits. Slopes are 2 to 8 percent. The mean annual precipitation is about 7 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy-skeletal, mixed, mesic Typic Paleorthids

Typical pedon: Luap very gravelly fine sandy loam, 2 to 4 percent slopes, is located in an area of map unit 1070. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 45 percent pebbles.

A--0 to 3 inches; light gray (10YR 7/2) very gravelly fine sandy loam, brown (10YR 5/3) moist; massive; slightly hard, very friable, nonsticky and nonplastic; common very fine roots; many very fine and few fine interstitial pores; 40 percent pebbles; violently effervescent; strongly alkaline (pH 8.8); clear wavy boundary.

Bw--3 to 12 inches; light gray (10YR 7/2) very gravelly very fine sandy loam, brown (10YR 5/3) moist; weak fine subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common very fine, few fine, and medium roots; many very fine and few fine interstitial pores; 35 percent pebbles; violently

effervescent; strongly alkaline (pH 9.0); abrupt wavy boundary.

Bk1--12 to 23 inches; very pale brown (10YR 8/4) very gravelly very fine sandy loam, light yellowish brown (10YR 6/4) moist; massive; hard, firm, nonsticky and nonplastic; common very fine roots; many very fine and few fine interstitial pores; 50 percent discontinuous weak lime cementation; few, fine soft lime masses; 40 percent pebbles; violently effervescent; strongly alkaline (pH 8.8); abrupt wavy boundary.

2Bk2--23 to 37 inches; variegated extremely gravelly coarse sand; single grain; loose, nonsticky and nonplastic; common very fine roots; many very fine interstitial pores; thin lime coats on undersides of pebbles; 70 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

3Bkm--37 to 44 inches; white (10YR 8/2) continuous strongly cemented lime hardpan, pale yellow (2.5Y 7/4) moist; massive; extremely hard, slightly rigid; 70 percent pebbles; violently effervescent; clear wavy boundary.

4Ck--44 to 61 inches; variegated extremely gravelly coarse sand; massive; hard, firm, nonsticky and nonplastic; many very fine interstitial pores; 50 percent discontinuous weak lime cementation; 80 percent pebbles; violently effervescent; moderately alkaline (pH 8.2).

Type location: Elko County, Nevada approximately 2 miles southeast of Montello, about 250 feet east and 2,400 feet south of the northwest corner of section 22, T. 39 N., R. 69 E.; (41 degrees, 15 minutes, 03 seconds north latitude and 114 degrees, 09 minutes, 36 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist for short periods in the winter and spring, dry late May through early November.

Soil temperature: 53 to 59 degrees F.

Depth to petrocalcic horizon: 20 to 40 inches.

Control section:

Clay content--8 to 18 percent.

Reaction--Moderately alkaline or strongly alkaline.

SAR--Ranges from 6 to 25 between depth of 10 inches to the petrocalcic horizon.

Rock fragments--Averages 45 to 70 percent pebbles.

A horizon:

Value--6 or 7 dry, 4 or 5 moist.
Chroma--2 or 3.

Bw horizons:

Value--6 or 7 dry, 4 or 5 moist.
Chroma--2 through 4.
Texture--Very gravelly very fine sandy loam or very gravelly loam.

Bk horizons:

Value--7 or 8 dry, 6 or 7 moist.
Chroma--2 through 4.
Texture--Very gravelly very fine sandy loam, fine sandy loam, or loam with extremely gravelly coarse sand or loamy sand common in the lower subhorizons of many pedons.

Mclvey Series

The Mclvey series consists of very deep, well drained soils that formed in colluvium derived from mixed rocks. The Mclvey soils are on hills and mountains. Slopes are 2 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, frigid Typic Argixerolls

Typical pedon: Mclvey gravelly loam, 30 to 50 percent slopes, is located in an area of map unit 040. (Colors are for dry soil unless otherwise noted.)

A1--0 to 3 inches; dark grayish brown (10YR 4/2) gravelly loam, very dark brown (10YR 2/2) moist; weak very fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots; common very fine tubular pores; 25 percent pebbles; neutral (pH 6.8); abrupt wavy boundary.

A2--3 to 13 inches; grayish brown (10YR 5/2) gravelly loam, very dark brown (10YR 2/2) moist; strong fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine and few fine tubular

pores; 30 percent pebbles; neutral (pH 6.8); clear wavy boundary.

AB--13 to 18 inches; brown (10YR 5/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; hard, friable, sticky and plastic; common very fine roots; many very fine and common fine tubular pores; few thin clay films lining pores; 30 percent pebbles and 5 percent cobbles; neutral (pH 6.8); clear wavy boundary.

2Bt1--18 to 23 inches; brown (10YR 5/3) very gravelly clay loam, dark brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; few very fine roots; many very fine and common fine tubular pores; common thin clay films on faces of peds and lining pores; 40 percent pebbles and 5 percent cobbles; slightly acid (pH 6.4); clear wavy boundary.

2Bt2--23 to 32 inches; light yellowish brown (10YR 6/4) very gravelly clay, yellowish brown (10YR 5/4) moist; strong medium angular blocky structure; very hard, firm, very sticky and very plastic; few very fine roots; many very fine and few fine tubular pores; many moderately thick clay films on faces of peds and lining pores; 45 percent pebbles and 5 percent cobbles; slightly acid (pH 6.3); gradual wavy boundary.

2Bt3--32 to 62 inches; light yellowish brown (10YR 6/4) very gravelly clay, yellowish brown (10YR 5/4) moist; massive; very hard, firm, very sticky and very plastic; few very fine roots; common very fine tubular pores; many moderately thick clay films lining pores; 45 percent pebbles and 5 percent cobbles; slightly acid (pH 6.3).

Type location: Elko County, Nevada; approximately 25 miles north of Wells, about 1,250 feet east and 2,000 feet north of the southwest corner of section 15, T. 41 N., R. 61 E.; (41 degrees, 26 minutes, 30 seconds north latitude and 115 degrees, 03 minutes, 49 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in the winter and spring, dry mid-July through October.

Soil temperature: 42 to 47 degrees F.

Mollic epipedon thickness: 12 to 20 inches, does not include the argillic horizon.

Control section:

Clay content--35 to 50 percent.
Rock fragments--Averages 35 to 60 percent, mainly pebbles and cobbles.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.
Chroma--1 through 3.

2Bt1 horizon:

Hue--7.5YR or 10YR.
Value--3 or 4 moist.
Chroma--3 or 4.
Texture--Very gravelly clay loam or gravelly clay loam.
Clay content--30 to 40 percent.
Rock fragments--15 to 40 percent pebbles, 0 to 5 percent cobbles.
Reaction--Slightly acid or neutral.
Other features--Moist and dry colors of this horizon do not meet the requirements of a mollic epipedon.

Lower 2Bt horizons:

Hue--7.5YR or 10YR.
Value--5 or 6 dry, 4 or 5 moist.
Chroma--3 through 6.
Texture--Very gravelly clay, very cobbly clay, or extremely cobbly clay with extremely cobbly clay loam common in some subhorizons below 40 inches.
Clay content--Commonly 40 to 50 percent, but some pedons have lower subhorizons with 30 to 40 percent.
Rock fragments--35 to 50 percent pebbles, 5 to 25 percent cobbles, 0 to 15 percent stones.
Structure--Subangular blocky, angular blocky, or prismatic throughout the profile but is commonly massive in the lower subhorizons.
Reaction--Slightly acid or neutral.

Nevador Series

The Nevador series consists of very deep, well drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. Nevador soils are on fan remnants and fan skirts. Slopes are 0 to 15 percent. The mean annual precipitation is about 9 inches, and the mean annual temperature is about 48 degrees F.

Taxonomic class: Fine-loamy, mixed, mesic Durixerollic Haplargids

Typical pedon: Nevador loam, 4 to 15 percent slopes, is located in an area of the map unit 160. (Colors are for dry soil unless otherwise noted.)

Ap--0 to 3 inches; pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; moderate very thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine and common fine interstitial pores; neutral (pH 7.2); abrupt smooth boundary.

A--3 to 6 inches; brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; weak thin platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots; common very fine and few fine interstitial pores; neutral (pH 7.2); clear smooth boundary.

Bt1--6 to 12 inches; pale brown (10YR 6/3) loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and few fine interstitial pores, few thin clay films bridging mineral grains; 5 percent pebbles; neutral (pH 7.2); clear smooth boundary.

Bt2--12 to 24 inches; light yellowish brown (10YR 6/4) clay loam, dark yellowish brown (10YR 4/4) moist; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; common very fine and fine roots; common very fine interstitial pores; common thin clay films bridging mineral grains; 5 percent pebbles; neutral (pH 7.3); clear smooth boundary.

Bqk1--24 to 43 inches; very pale brown (10YR 7/3) sandy loam, brown (10YR 5/3) moist; massive; hard, slightly sticky and nonplastic; few very fine and fine roots; common very fine interstitial pores; 50 percent 10 to 20 millimeter durinodes; few fine soft lime filaments, in a noneffervescent matrix; 5 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

Bqk2--43 to 52 inches; very pale brown (10YR 7/3) sandy loam, brown (10YR 5/3) moist; massive; hard, friable, nonsticky and nonplastic; few very fine and fine roots; common very fine interstitial pores; 30 percent hard, 10 to 20 millimeters, durinodes in a discontinuous weakly silica cemented matrix; few fine soft lime filaments in a noneffervescent matrix; 5 percent

pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

Bqk3--52 to 61 inches; very pale brown (10YR 7/3) sandy loam, brown (10YR 5/3) moist; massive; hard, friable, nonsticky and nonplastic; few fine roots; common very fine interstitial pores; 60 percent discontinuous weakly silica cemented with 10 percent, 10 to 20 millimeter, hard durinodes; few fine soft lime filaments; violently effervescent; 5 percent pebbles; slightly alkaline (pH 7.5).

Type location: Elko County, Nevada; approximately 4 miles northeast of Wells; about 200 feet south and 1,400 feet west of the northeast corner of section 25, T. 38 N., R. 62 E.; (41 degrees, 09 minutes, 22 seconds north latitude and 114 degrees, 54 minutes, 39 west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring; dry June through October.

Soil temperature: 47 to 52 degrees F.

Depth to base of the Bt horizons: 12 to 24 inches.

Depth to Bqk horizon: 18 to 37 inches.

Mineralogy: Mixed with some influence from vitric pyroclastic materials.

Control section:

Clay content--25 to 35 percent.

Effervescence--The A and Bt horizons are noncalcareous.

A horizons:

Value--5 or 6 dry, 3 or 4 moist. The average value of the upper 7 inches is greater than 5.5 dry.

Chroma--2 or 3.

Reaction--Neutral or slightly alkaline.

Bt horizons:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 through 4. Chroma of 4 only when rubbed moist.

Texture--Sandy clay loam, clay loam or loam.

Structure--Weak to strong, fine through coarse prismatic, subangular blocky or angular blocky.

Reaction--Neutral to moderately alkaline.

Rock fragments--5 to 10 percent pebbles.

Bqk horizon:

Value--5 through 7 dry, 3 through 5 moist.

Chroma--2 or 3.

Texture--Stratified gravelly fine sandy loam to loamy sand.

Reaction--Slightly alkaline through strongly alkaline.

Other features--20 to 70 percent durinodes with few very thin (2 millimeters thick) discontinuous and unoriented silica laminae. The durinodes are hard or very hard, firm or very firm, and include some durinodes that are extremely hard and extremely firm. Some pedons have thin strata of sand and gravel.

Nirac Series

The Nirac series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from mixed rocks, loess, and volcanic ash. The Nirac soils are on hills and mountains. Slopes are 8 to 75 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Aridic Calcixerolls

Typical pedon: Nirac gravelly silt loam, 15 to 50 percent slopes, is located in an area of map unit 2030. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 60 percent pebbles.

A1--0 to 4 inches; dark grayish brown (10YR 4/2) gravelly silt loam, very dark brown (10YR 2/2) moist; moderate very fine granular structure; soft, very friable, nonsticky and slightly plastic; many very fine roots; common very fine interstitial and few fine tubular pores; 25 percent pebbles; violently effervescent; moderately alkaline (pH 8.3); clear wavy boundary.

A2--4 to 10 inches; grayish brown (10YR 5/2) gravelly silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure parting to moderate very fine granular; soft, very friable, slightly sticky and slightly plastic; many very fine, common fine and medium roots; common very fine interstitial and few fine tubular pores; thin lime coats on undersides of rock fragments; 25 percent

pebbles; strongly effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

A3--10 to 16 inches; brown (10YR 5/3) very gravelly silt loam, dark brown (10YR 3/3) moist; common fine and medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine, common fine and medium roots; common very fine interstitial and few fine tubular pores; 50 percent pebbles; thin lime coats on undersides of rock fragments; strongly effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

Bk1--16 to 21 inches; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine roots; many very fine interstitial pores; 2 to 5 millimeter thick lime pendants on bottom of rock fragments; 50 percent pebbles; strongly effervescent; strongly alkaline (pH 8.5); clear wavy boundary.

Bk2--21 to 26 inches; light gray (10YR 7/2) very gravelly loam, brown (10YR 5/3) moist; massive; soft, very friable, slightly sticky and nonplastic; common very fine and fine roots; common very fine interstitial pores; thin lime coats covering rock fragments with 2 to 5 millimeters thick lime pendants; common fine lime filaments; 50 percent pebbles and 5 percent cobbles; strongly effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

Bk3--26 to 36 inches; light gray (10YR 7/2) very gravelly loam, brown (10YR 5/3) moist; massive; soft, very friable, slightly sticky and nonplastic; common very fine roots; many very fine interstitial pores; thin lime coats covering rock fragments with 1 to 3 millimeter thick lime pendants; 50 percent pebbles and 5 percent cobbles; strongly effervescent; strongly alkaline (pH 8.8); abrupt wavy boundary.

2R--36 inches; fractured dolomite rock.

Type location: Elko County, Nevada; approximately 10 miles northwest of Montello; about 2,500 feet west and 750 feet south of the northeast corner of section 9, T. 40 N., R. 68 E.; (41 degrees, 22 minutes, 13 seconds north latitude and 114 degrees, 17 minutes, 09 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in late fall through early summer, dry July through October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 10 to 17 inches.

Depth to bedrock: 20 to 40 inches.

Depth to calcic horizon: 10 to 17 inches.

Control section:

Clay content--15 to 25 percent.

Rock fragments--35 to 60 percent pebbles with 0 to 10 percent cobbles.

Other features--Secondary lime increases with depth.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Reaction--Slightly alkaline or moderately alkaline.

Bk horizon:

Value--6 or 7 dry, 3 through 5 moist.

Chroma--2 through 4.

Texture--Very gravelly loam or very gravelly silt loam.

Clay content--15 to 25 percent.

Rock fragments--35 to 60 percent pebbles with 0 to 10 percent cobbles.

Structure--Weak subangular blocky or it is massive.

Calcium carbonate equivalent--25 to 40 percent.

Reaction--Moderately alkaline or strongly alkaline.

Ocala Series

The Ocala series consists of very deep, somewhat poorly drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. Ocala soils are on stream terraces, flood plains, lake plains, inset fans, and drainageways. Slopes are 0 to 2 percent. The mean annual precipitation is about 7 inches and the mean annual temperature is about 50 degrees F.

Taxonomic class: Fine-silty, mixed (calcareous), mesic Aeric Halaquepts

Typical pedon: Ocala silt loam, 0 to 2 percent slopes is located in an area of the map unit 340. (Colors are for dry soil unless otherwise noted.)

A--0 to 3 inches; very pale brown (10YR 7/3) silt loam, yellowish brown (10YR 5/4) moist; moderate thick platy structure; slightly hard, friable, moderately sticky and slightly plastic; few very fine, fine and medium roots; many very fine and fine vesicular pores; violently effervescent; strongly alkaline (pH 9.0); clear smooth boundary.

C--3 to 8 inches; very pale brown (10YR 7/3) silty clay loam, yellowish brown (10YR 5/4) moist; weak medium platy structure; slightly hard, friable, very sticky and moderately plastic; common very fine, few fine, and medium roots; common very fine and fine tubular pores; violently effervescent; very strongly alkaline (pH 9.4); clear smooth boundary.

Cqk1--8 to 13 inches; very pale brown (10YR 7/3) silt loam, yellowish brown (10YR 5/4) moist; strong thin and medium platy structure; slightly hard, friable, very sticky and moderately plastic; common very fine, fine, and few medium and coarse roots; common very fine tubular pores; 20 percent, 5 to 15 millimeter durinodes; violently effervescent; very strongly alkaline (pH 9.4); clear smooth boundary.

Cqk2--13 to 23 inches; very pale brown (10YR 7/3) silt loam, yellowish brown (10YR 5/4) moist; common medium distinct brown (10YR 4/3) and yellowish brown (10YR 5/6) mottles, moist; strong thin and medium platy structure; hard, firm and brittle, very sticky and moderately plastic; few very fine, fine and medium roots; common very fine and fine tubular pores; many fine thread like gypsum crystals along pores and in masses; continuous brittle matrix; violently effervescent; very strongly alkaline (pH 9.4); clear smooth boundary.

Cqk3--23 to 29 inches; very pale brown (10YR 7/3) silty clay loam, light yellowish brown (10YR 6/4) moist; few medium distinct grayish brown (10YR 5/2) mottles; strong thick platy; very hard, firm, very sticky and moderately plastic; few fine roots; few very fine tubular pores; 30 percent durinodes; many thin silica coats lining pores; common fine thread like gypsum crystals; weak continuous brittle matrix; violently effervescent; very strongly alkaline (pH 9.2); clear smooth boundary.

Cqk4--29 to 40 inches; very pale brown (10YR 7/3) silt loam, yellowish brown (10YR 5/4) moist; few medium distinct brown (10YR 4/3) mottles; massive; hard, firm and brittle, very sticky and plastic; few fine roots; common very fine and few coarse tubular pores; 10 percent very firm durinodes; few thin discontinuous silica laminae; many thin silica coats lining pores; common fine thread like gypsum crystals; continuous brittle matrix; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Cqk5--40 to 46 inches; very pale brown (10YR 7/3) silt loam, yellowish brown (10YR 5/4) moist; few medium faint dark yellowish brown (10YR 4/4) mottles; massive; very hard, firm and brittle, very sticky and moderately plastic; common very fine and few coarse tubular pores; many fine masses and thread like gypsum crystals; continuous brittle matrix; violently effervescent; moderately alkaline (pH 8.2); clear smooth boundary.

2Cqk6--46 to 60 inches; very pale brown (10YR 7/3) silt loam, yellowish brown (10YR 5/4) moist; common large faint dark yellowish brown (10YR 4/4) mottles massive; hard, firm, very sticky and moderately plastic; few very fine tubular pores; 20 percent firm durinodes; common fine gypsum crystals; violently effervescent; strongly alkaline (pH 8.5).

Type location: Elko County, Nevada; approximately 8 miles south of Jackpot; about 750 feet west and 2,000 feet south of the northeast corner of section 23, T. 46 N., R. 64 E.; (41 degrees, 51 minutes, 37 seconds north latitude and 114 degrees, 40 minutes, 39 seconds west longitude.)

Range in Characteristics:

Soil moisture: These soils are usually saturated within depths of 40 inches for one month or more during most years.

Soil temperature: 50 to 54 degrees F.

Depth to weakly cemented horizon: 13 to 30 inches.

Salt and sodium: These soils are normally strongly salt and alkali affected within the surface 10 inches.

Mottles: Iron mottles occur below 12 inches.

Control section:

Clay content--18 to 35 percent.

Segregated lime--Lime concretions are normally below depths of 35 inches but are lacking in some pedons.

Cementation--More than one weakly cemented horizon is in some pedons; some pedons have horizons with 20 to 70 percent durinodes in a friable matrix above the weakly cemented horizons.

Reaction--Strongly alkaline to very strongly alkaline.

Other features--Strata or lenses of volcanic ash, up to 4 inches thick, are in most pedons, especially below 30 inches. These ash strata are usually noncalcareous and slightly alkaline.

A horizon:

Hue--10YR to 5Y.

Value--6 through 8 dry, 4 through 7 moist.

Chroma--1 through 4.

C and Cqk horizons:

Hue--10YR to 5Y.

Value--6 through 8 dry, 4 through 7 moist.

Chroma--1 through 4.

Texture--Silty clay loam or silt loam with thin strata of clay loam, loam, or silty clay in some pedons.

Structure--Platy, massive or angular block

Ocala Variant

Ocala variant consists of very deep, very poorly drained soils that formed in alluvium derived from mixed rocks. Ocala variant soils are on floodplains. Slopes are 0 to 2 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Fine, montmorillonitic (calcareous), mesic Typic Halaquepts

Typical pedon: Ocala variant silty clay loam, frequently flooded, 0 to 2 percent slopes, is located in an area of map unit 185. (Colors are for dry soil unless otherwise noted.)

A--0 to 5 inches; white (10YR 8/2) silty clay loam, brown (10YR 5/3) moist; few fine distinct brown (7.5YR 5/4) moist mottles; weak medium platy structure parting to moderate very thin platy; hard, firm, very sticky and

moderately plastic; common very fine, fine and medium roots; common very fine interstitial pores; violently effervescent; strongly alkaline (pH 8.8); clear smooth boundary.

C1--5 to 15 inches; white (10YR 8/2) silty clay loam, brown (10YR 5/3) moist; weak very thin platy structure; hard, firm, very sticky and moderately plastic; few very fine, common fine and medium roots; many very fine and few fine interstitial pores; violently effervescent; strongly alkaline (pH 8.6); clear smooth boundary.

C2--15 to 23 inches; white (10YR 8/2) silty clay loam, brown (10YR 5/3) moist; massive; hard, firm, very sticky and moderately plastic; few very fine, fine and medium roots; many very fine, fine, and medium interstitial pores; violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

C3--23 to 28 inches; white (10YR 8/1) silty clay loam, grayish brown (10YR 5/2) moist; common medium distinct brown (7.5YR 5/4) moist mottles; massive; very hard, very firm, very sticky and very plastic; few very fine, fine and medium roots; many very fine, few fine interstitial and many medium tubular pores; strongly effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

2Ab1--28 to 31 inches; light gray (10YR 7/1) silty clay, dark grayish brown (10YR 4/2) moist; common fine prominent dark yellowish brown (10YR 3/4) and common medium distinct black (10YR 2/1) moist mottles; massive; very hard, very firm, very sticky, and very plastic; common very fine, few fine, and medium roots; few very fine interstitial pores; slightly effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

2Ab2--31 to 41 inches; light gray (10YR 7/1) silty clay, dark gray (5Y 4/1) moist; few medium prominent dark brown (10YR 3/3) moist mottles; massive; very hard, very firm, very sticky and very plastic; common very fine tubular pores; slightly effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

2C--41 to 61 inches; light gray (10YR 7/1) silty clay, greenish gray (5G 5/1) moist; massive; very hard, very firm, very sticky, and very plastic; few very fine, fine, and medium roots; common very fine interstitial pores; moderately alkaline (pH 8.4).

Type location: Elko County, Nevada; approximately 8 miles northwest of Montello; about 2,300 feet west and 2,200 feet south of the northeast

Elko County, Nevada, Northeast Part--Part I

corner of section 13, T. 40 N., R. 69 E.; (41 degrees, 21 minutes, and 07 seconds north latitude and 114 degrees, 06 minutes, and 27 seconds west longitude.)

Range in Characteristics:

Soil moisture: Saturated at or near the surface for at least one month during most years, mainly during the late winter and early spring. It drops to a depth of 20 to 40 inches from early spring through September.

Soil temperature: 53 to 57 degrees F.

Control section:

Percent clay--35 to 50 percent.

Texture--Silty clay loam or silty clay.

SAR--Averages greater than 13 in half or more of the upper 20 inches, decreases with depth.

A horizon:

Value--7 or 8 dry, 4 or 5 moist.

Chroma--2 or 3.

Reaction--Moderately alkaline or strongly alkaline.

Other features--Buried A horizons are common.

C horizons:

Hue--2.5Y, 5Y, 5G or 10YR.

Value--7 or 8 dry, 4 or 5 moist.

Chroma--1 or 2.

Reaction--Moderately alkaline or strongly alkaline.

Ola Series

The Ola series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from granitic rocks. Ola soils are on mountains. Slopes are 4 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Coarse-loamy, mixed, frigid Pachic Haploxerolls

Typical pedon: Ola gravelly coarse sandy loam, 15 to 50 percent slopes, is located in an area of map unit 300. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 20 percent pebbles and 5 percent cobbles.

A1--0 to 6 inches; very dark grayish brown (10YR 3/2) gravelly coarse sandy loam, black (10YR 2/1) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common very fine tubular and many fine interstitial pores; 15 percent pebbles; neutral (pH 6.8); clear smooth boundary.

A2--6 to 10 inches; very dark grayish brown (10YR 3/2) gravelly coarse sandy loam, very dark brown (10YR 2/2) moist; moderate medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; many very fine and common fine roots; many very fine tubular and common fine interstitial pores; 30 percent pebbles; neutral (pH 6.8); gradual smooth boundary.

A3--10 to 14 inches; dark grayish brown (10YR 4/2) gravelly coarse sandy loam, very dark brown (10YR 2/2) moist; moderate medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; many very fine and common fine roots; many very fine tubular and common fine interstitial pores; 25 percent pebbles; neutral (pH 6.8); clear smooth boundary.

A4--14 to 19 inches; dark grayish brown (10YR 4/2) gravelly coarse sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; common fine and few medium roots; many very fine tubular and common fine interstitial pores; 30 percent pebbles; neutral (pH 7.0); clear smooth boundary.

C--19 to 29 inches; brown (10YR 5/3) gravelly coarse sandy loam, dark brown (10YR 3/3) moist; massive; soft, very friable, nonsticky and nonplastic; common fine and few medium roots; common fine tubular and many fine interstitial pores; 30 percent pebbles; neutral (pH 7.2); gradual smooth boundary.

Cr--29 to 35 inches; highly weathered granite.

R--35 inches; hard granite.

Type location: Elko County, Nevada; approximately 15 miles south of Jackpot in an unsurveyed area of the Granite Range; about 3 miles south and 375 feet east of the southwest corner of section 35, T. 45 N., R. 64 E.; (41 degrees, 41 minutes, 38 seconds north latitude and 114 degrees, 42 minutes, 06 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; dry from about mid July to October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 20 to 40 inches.

Depth to bedrock: 30 to 40 inches.

Depth to paralithic contact: 20 to 38 inches.

Control section:

Clay content--5 to 15 percent.

Rock fragments--15 to 35 percent.

Reaction--Slightly acid or neutral.

A horizons:

Value--3 through 5 dry, 2 or 3 moist.

Chroma--1 or 2.

C horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Texture--Gravelly coarse sandy loam, or gravelly sandy loam.

Rock fragments--15 to 30 percent pebbles.

Onkeyo Series

The Onkeyo series consists of shallow, well drained soils that formed in residuum and colluvium derived from limestone and dolomite.

The Onkeyo soils are on mountains and hills.

Slopes are 4 to 50 percent. The mean annual precipitation is about 16 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Lithic Calcixerolls

Typical pedon: Onkeyo very gravelly silt clay loam, 15 to 50 percent slopes, is located in an area of map unit 560. (Colors are for dry soil unless otherwise noted.) The soil is partially covered with 60 percent pebbles, 5 percent cobbles, and 2 percent stones.

A1--0 to 3 inches; brown (10YR 5/3) very gravelly silty clay loam, dark brown (10YR 3/3) moist; weak very fine granular structure; slightly hard, very friable, moderately sticky and moderately plastic; common very fine roots; many very fine and few fine tubular pores; common thin lime coats on undersides of rock fragments; 40 percent pebbles, 5 percent cobbles; violently

effervescent (4 percent calcium carbonate equivalent); slightly alkaline (pH 7.8); clear wavy boundary.

A2--3 to 8 inches; brown (10YR 5/3) very gravelly silty clay loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; common very fine and few fine roots; many very fine and few fine tubular pores; common thin lime coats on undersides of rock fragments; 35 percent pebbles and 10 percent cobbles; violently effervescent (6 percent calcium carbonate equivalent); slightly alkaline (pH 7.8); clear wavy boundary.

Bk--8 to 15 inches; light yellowish brown (10YR 6/4) extremely cobbly silty clay loam, yellowish brown (10YR 5/4) moist; weak medium angular blocky structure; very hard, firm, moderately sticky and moderately plastic; few very fine and fine roots; many very fine and common fine tubular pores; common thick lime coats on undersides of rock fragments; 20 percent pebbles, 40 percent cobbles, and 5 percent stones; violently effervescent (22 percent calcium carbonate equivalent); moderately alkaline (pH 8.0); abrupt irregular boundary.

R--15 inches; hard fractured limestone.

Type location: Elko County, Nevada; approximately 24 miles north of Wells in the Snake Mountains; about 1,400 feet south and 1,500 feet west of the northeast corner of section 15, T. 41 N., R. 61 E.; (41 degrees, 26 minutes, 49 seconds north latitude and 115 degrees, 03 minutes, 17 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist from late fall through spring, dry mid-July through October.

Soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 7 to 10 inches.

Depth to calcic horizon: 7 to 10 inches.

Depth to bedrock: 14 to 20 inches.

Control section:

Percent clay--27 to 35 percent.

Reaction--Slightly alkaline or moderately alkaline.

Rock fragments--50 to 80 percent, mainly cobbles.

A horizons:

Value--4 or 5 dry, 3 or 4 moist.

Effervescence--Slightly effervescent to violently effervescent.

Calcium carbonate equivalent--1 to 10 percent.

Bk horizon:

Value--6 or 7 dry, 3 through 5 moist.

Chroma--3 or 4.

Texture--Very cobbly silty clay loam, extremely cobbly silty clay loam.

Clay content--27 to 35 percent.

Rock fragments--50 to 80 percent, mainly cobbles.

Structure--Subangular blocky or angular blocky.

Calcium carbonate equivalent--15 to 35 percent.

Other features--Thin to thick lime coats on undersides of rock fragments.

Orovada Series

The Orovada series consists of very deep, well drained soils that formed in loess over alluvium derived from mixed rocks. The Orovada soils are on fan skirts, stream terraces, and inset fans. Slopes are 0 to 30 percent. The mean annual precipitation is about 8 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Coarse-loamy, mixed, mesic Durixerollic Camborthids

Typical pedon: Orovada very fine sandy loam, 2 to 8 percent slopes, is located in an area of map unit 930. (Colors are for dry soils unless otherwise noted.)

A1--0 to 3 inches; pale brown (10YR 6/3) very fine sandy loam, dark grayish brown (10YR 4/2) moist; moderate very thin and thin platy structure; slightly hard, very friable, nonsticky and nonplastic; common very fine, few fine, medium, and coarse roots; many very fine interstitial, vesicular, and few fine tubular pores; slightly alkaline (pH 7.8); clear wavy boundary.

A2--3 to 7 inches; light brownish gray (10YR 6/2) very fine sandy loam, brown (10YR 4/3) moist; moderate very thin and thin platy structure; soft, very friable, slightly sticky and slightly plastic; common very fine, few fine, medium and coarse roots; common very fine interstitial,

few fine, and medium tubular pores; slightly alkaline (pH 7.8); abrupt wavy boundary.

Bw--7 to 13 inches; pale brown (10YR 6/3) very fine sandy loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine, medium and coarse roots; common very fine interstitial, few fine, and medium tubular pores; slightly effervescent; slightly alkaline (pH 7.8); clear wavy boundary.

Bqk1--13 to 19 inches; light gray (2.5Y 7/2) loam, light olive brown (2.5Y 5/4) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; common very fine, and few fine interstitial, and tubular pores; 5 percent 1/2 inch hard durinodes; strongly effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

Bqk2--19 to 39 inches; light gray (2.5Y 7/2) very fine sandy loam, light olive brown (2.5Y 5/4) moist; massive; slightly hard, friable, nonsticky and nonplastic; few very fine roots; common very fine interstitial pores; 25 percent 1/2 to 3 inch hard durinodes; strongly effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

Bqk3--39 to 65 inches; light gray (2.5Y 7/2) silt loam, light olive brown (2.5Y 5/4) moist; massive; slightly hard, friable, slightly sticky and nonplastic; few very fine roots; common very fine and few fine interstitial pores; 25 percent 1/2 to 3 inch hard durinodes; strongly effervescent; moderately alkaline (pH 8.4).

Type location: Elko County, Nevada; approximately 17 miles north of Thousand Springs in the Knoll Creek drainage; about 1,940 feet east and 2,500 feet south of the northwest corner of section 35, T. 44 N., R. 63 E.; (41 degrees, 39 minutes, 26 seconds north latitude and 114 degrees, 48 minutes, 43 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from late June through early November.

Soil temperature: 47 to 52 degrees F.

Depth to Bq or Bqk horizon: 10 to 28 inches.

Control section:

Clay content--5 to 18 percent.

Rock fragments--0 to 15 percent, mainly pebbles.
 Other features--When mixed, value of the upper 7 inches is greater than 5.5 dry and 3.5 moist.

A horizons:

Hue--10YR or 2.5Y.
 Value--5 through 7 dry, 3 or 4 moist.
 Chroma--2 through 4.
 Reaction--Neutral through moderately alkaline.

Bw horizon:

Hue--10YR or 2.5Y.
 Value--6 or 7 dry, 3 through 5 moist.
 Chroma--2 through 6.
 Texture--Fine sandy loam, very fine sandy loam, loam, silt loam.
 Clay content--5 to 18 percent.
 Rock fragments--Averages 0 to 15 percent pebbles.
 Structure--Subangular blocky, prismatic, or horizon is massive.
 Reaction--Slightly alkaline or moderately alkaline.

Bq or Bqk horizon:

Hue--10YR or 2.5Y.
 Value--6 or 7 dry, 3 through 5 moist.
 Chroma--2 through 6.
 Texture--Fine sandy loam, very fine sandy loam, loam, silt loam.
 Rock fragments--Up to 30 percent pebbles in some subhorizons of some pedons.
 Reaction--Moderately alkaline through very strongly alkaline, increasing with depth.
 Cementation--Contains 20 to 80 percent durinodes.
 Other features--Gypsum crystals are below depths of 37 inches in some pedons.

Oupico Series

The Oupico series consists of moderately deep to a duripan, well drained that formed in alluvium derived from mixed rocks. Oupico soils are on fan remnants. Slopes are 0 to 30 percent. Mean annual precipitation is about 9 inches, and the mean annual temperature is about 47 degrees F.

Taxonomic class: Coarse-loamy, mixed, mesic Xerollic Durorthids

Typical pedon: Oupico loam, 2 to 4 percent slopes, is located in an area of map unit 691. (Colors are for dry soil unless otherwise noted.)

- Ap--0 to 2 inches; light brownish gray (10YR 6/2) loam, dark grayish brown (10YR 4/2) moist; moderate very thin platy structure; slightly hard, very friable, nonsticky and nonplastic; many very fine roots; common very fine interstitial pores; moderately alkaline (pH 7.9); clear smooth boundary.
- A--2 to 4 inches; light brownish gray (10YR 6/2) silt loam, dark brown (10YR 4/3) moist; weak thick platy structure; slightly hard, very friable, nonsticky and nonplastic; common very fine and few fine roots; common very fine interstitial pores; moderately alkaline (pH 7.9); clear smooth boundary.
- Bk--4 to 13 inches; pale brown (10YR 6/3) loam, dark brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, friable, nonsticky and nonplastic; common very fine and few fine roots; common very fine interstitial pores; 5 percent pebbles; violently effervescent; moderately alkaline (pH 8.0); clear smooth boundary.
- Bqk--13 to 25 inches; light gray (10YR 7/2) loam, brown (10YR 5/3) moist; massive; hard, firm, nonsticky and nonplastic; few very fine roots; few very fine interstitial pores; discontinuous weakly cemented matrix; 10 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); clear smooth boundary.
- Bqkm--25 to 49 inches; white (10YR 8/2) indurated duripan with 1 to 3 millimeters laminar cap alternating with thin discontinuous strongly cemented laminae, very rigid; violently effervescent; moderately alkaline (pH 8.4); clear wavy boundary.
- Cqk1--49 to 56 inches; very pale brown (10YR 8/3) sandy loam, very pale brown (10YR 7/3) moist; massive; extremely hard, extremely firm, nonsticky and nonplastic; few very fine roots; few very fine interstitial pores; 40 percent hard durinodes; discontinuous weakly silica cemented matrix; 10 percent pebbles; strongly alkaline (pH 8.6); clear smooth boundary.
- Cqk2--56 to 62 inches; white (10YR 8/2) very fine sandy loam, light gray (10YR 7/2) moist; massive; hard, firm, nonsticky and nonplastic; 30 percent hard durinodes; discontinuous weakly silica cemented matrix; strongly alkaline. (pH 8.6).

Type location: Elko County, Nevada; approximately 3 miles northeast of Wells; about 1,600 feet north and 2,700 feet west of the southeast corner of section 36, T. 38 N., R. 62 E.; (41 degrees, 07 minutes, 53 seconds north latitude and 114 degrees, 54 minutes, 56 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry June through October.

Soil temperature: 47 to 51 degrees F.

Depth to duripan: 20 to 40 inches.

Depth to Bk horizon: 2 to 5 inches.

Control section:

Percent clay--8 to 18 percent.

Rock fragments--5 to 25 percent, mainly pebbles.

A horizons:

Value--6 or 7 dry.

Chroma--2 through 4.

Effervescence--Noneffervescent to slightly effervescent.

Reaction--Slightly alkaline or moderately alkaline.

Bk horizon:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--3 or 4.

Texture--Gravelly loam, loam, sandy loam.

Carbonates--Disseminated lime, soft pockets or films.

Bqk horizon:

Hue--7.5YR or 10YR.

Value--6 through 8 dry; 5 through 7 moist.

Chroma--2 through 4.

Texture--Gravelly loam, loam, sandy loam.

Cementation--Thin coatings of silica or discontinuous weakly silica cemented layers.

Pamison Series

The Pamison series consists of very deep, moderately well drained soils that formed in alluvium derived from mixed rocks. The Pamison soils are on fan remnants. Slopes are 4 to 30 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 44 degrees. F.

Taxonomic class: Loamy-skeletal, mixed, frigid Aridic Calcixerolls

Typical pedon: Pamison gravelly loam, 4 to 15 percent slopes, is located in an area of map unit 850. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 60 percent pebbles.

A1--0 to 1 inch; light brownish gray (10YR 6/2) gravelly loam, dark grayish brown (10YR 4/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, common fine, medium, and few coarse roots; many very fine and fine vesicular and few very fine and fine tubular pores; 30 percent pebbles; slightly effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

A2--1 to 7 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; few fine faint yellowish brown (10YR 5/4) mottles; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine and medium roots; common very fine and fine tubular pores; 25 percent pebbles; slightly effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

Bk--7 to 10 inches; pale brown (10YR 6/3) gravelly loam, brown (10YR 4/3) moist; few fine distinct brownish yellow (10YR 6/6) moist mottles; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine and medium roots; common very fine and fine tubular pores; 25 percent pebbles; strongly effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

Bkq1--10 to 13 inches; pale brown (10YR 6/3) gravelly loam, brown (10YR 4/3) moist; few fine distinct brownish yellow (10YR 6/6) mottles; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine and fine tubular pores; 40 percent hard and firm weak discontinuous lime and silica cementation; 30 percent pebbles; common thin lime pendants on the undersides of pebbles; violently effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

2Bkq2--13 to 24 inches; very pale brown (10YR 7/3) very gravelly sandy loam, brown (10YR 5/3) moist; massive; hard, firm, nonsticky and

slightly plastic; few very fine and fine roots; few very fine, fine and medium tubular pores; 50 percent very hard and very firm discontinuous strong lime and silica cementation; 10 percent brittle when wet; few fine soft masses, seams and filaments of lime; many thin to very thick lime pendants on the undersides of pebbles; 50 percent pebbles; violently effervescent; strongly alkaline (pH 8.6); abrupt wavy boundary.

3Ckq--24 to 60 inches; very pale brown (10YR 7/3) very gravelly loamy sand, yellowish brown (10YR 5/4) moist; single grain; loose, nonsticky and nonplastic; common very fine and fine roots; few very fine and fine tubular pores; 25 percent hard and firm discontinuous weak lime and silica cementation; few fine soft masses, seams and filaments of lime; common thin lime pendants on the undersides of pebbles; 50 percent pebbles; violently effervescent; strongly alkaline (pH 8.6).

Type location: Elko County, Nevada; approximately 30 miles north of Pequop in an unsectionized area; about 1 mile and 1,220 feet north and 2,875 feet east of the northwest corner of section 3, T. 43 N., R. 65 E.; (41 degrees, 34 minutes, 40 seconds north latitude and 114 degrees, 35 minutes, 45 seconds west longitude.)

Range in Characteristics:

Soil moisture: These soils are moist in winter and spring, dry from late June through October.

Soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 7 to 16 inches.

Depth to calcic horizon: 7 to 20 inches.

Control section:

Clay content--Averages 8 to 15 percent.

Rock fragments--Averages 35 to 60 percent, mainly pebbles.

A horizons:

Value--5 or 6 dry, 3 or 4 moist; the upper 7 inches when mixed is darker than 5.5 dry, and 3.5 when moist.

Chroma--2 or 3.

Effervescence--None to slight.

Mottles--None to few, faint or distinct.

Bk and Bkq1 horizons:

Value--5 through 7 dry; 4 or 5 moist.

Chroma--3 or 4.

Clay content--18 to 25 percent.

Rock fragments--20 to 35 percent.

Structure--Weak or moderate subangular blocky or is massive.

Consistence--Slightly hard to very hard dry, friable to very firm moist.

Calcium carbonate equivalent--0 to 15 percent.

Effervescence--Strongly effervescent or violently effervescent.

Cementation--Weak discontinuous and is comprised dominantly of lime with some accessory silica present.

Mottles--Few or common.

2Bkq2 horizon:

Value--5 through 7 dry, 4 or 5 moist.

Chroma--3 or 4.

Texture--Very gravelly sandy loam or extremely gravelly sandy loam.

Clay content--10 to 20 percent.

Rock fragments--45 to 70 percent, mostly pebbles.

Structure--Weak or moderate subangular blocky or is massive.

Consistence--Slightly hard to very hard dry, friable to very firm moist.

Calcium carbonate equivalent--15 to 30 percent.

Secondary carbonates--Occurs as seams, soft masses, filaments or as pendants on the undersides of pebbles.

Reaction--Moderately alkaline or strongly alkaline.

Effervescence--Strongly effervescent or violently effervescent.

Cementation--Weak discontinuous and is comprised dominantly of lime with some accessory silica present.

3Ckq horizons:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--3 or 4.

Texture--Very gravelly loamy sand or extremely gravelly loamy sand.

Clay content--5 to 10 percent.

Rock fragments--45 to 70 percent, mostly pebbles.

Reaction--Moderately alkaline or strongly alkaline.

Calcium carbonate equivalent--5 to 15 percent.

Peeko Series

The Peeko series consists of shallow to duripan, well drained soils that formed in loess over alluvium derived from mixed rocks. Peeko soils are on fan remnants. Slopes are 2 to 30 percent. The mean annual precipitation is about 9 inches, and the mean annual temperature is about 48 degrees F.

Taxonomic class: Loamy, mixed, mesic, shallow Xerollic Durorthids

Typical pedon: Peeko silt loam, 2 to 8 percent slopes, is located in an area of map unit 121. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 25 percent pebbles.

A--0 to 2 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; moderate thin platy structure; hard, friable, sticky and slightly plastic; few very fine and fine roots; common very fine interstitial, many very fine and fine vesicular pores; 10 percent pebbles; slightly effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.

AB--2 to 5 inches; pale brown (10YR 6/3) gravelly silt loam, brown (10YR 4/3) moist; moderate fine subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine and fine roots; many very fine interstitial pores; 25 percent pebbles; strongly effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

Bqk--5 to 10 inches; very pale brown (10YR 7/3) gravelly silt loam, brown (10YR 5/3) moist; massive; hard, friable, sticky and plastic; many very fine, fine, common medium, and few coarse roots; many very fine interstitial pores; 10 percent weakly cemented durinodes; 25 percent pebbles and duripan fragments; strongly effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

Bqkm--10 to 35 inches; white (10YR 8/1) indurated duripan, white (10YR 8/1) moist; massive; very rigid; continuous 1 to 2 millimeters thick horizontal silica laminae on upper surface; 60 percent pebbles; violently effervescent; clear wavy boundary.

Type location: Elko County, Nevada; approximately 27 miles north of Wells; about 500 feet west

and 1,250 feet north of the southeast of corner of section 5, T. 41 N., R. 64 E.; (41 degrees, 27 minutes, 50 seconds north latitude and 114 degrees, 44 minutes, 40 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry June to October.

Soil temperature: 47 to 52 degrees F.

Depth to indurated duripan: 10 to 20 inches.

Control section:

Clay content--18 to 27 percent.

Rock fragments--Averages 15 to 35 percent, mainly pebbles of which approximately 80 to 90 percent are comprised of duripan fragments.

A horizon:

Value--6 or 7 dry, 3 or 4 moist.
Chroma--2 or 3.

AB horizon:

Value--6 or 7 dry, 4 or 5 moist.
Chroma--2 through 4.
Structure--Subangular blocky or is massive.

Bqk horizon:

Value--6 through 8 dry, 4 through 6 moist.
Chroma--3 or 4.
Cementation--10 to 40 percent weak or strongly cemented durinodes.
Texture--Very gravelly silt loam, gravelly silt loam or very cobbly silt loam.
Rock fragments--15 to 40 percent pebbles and duripan fragments of which up to 30 percent are cobbles.

Pequop Series

The Pequop series consists of very deep, well drained soils that formed in colluvium and residuum derived from mixed rocks. Pequop soils are on side slopes of hills, mountains, and pediments. Slopes are 8 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Typic Argixerolls

Typical pedon: Pequop gravelly loam, 15 to 50 percent slopes, is located in an area of map unit 419. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 35 percent pebbles and 5 percent cobbles.

A1--0 to 3 inches; brown (10YR 5/3) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak medium and thick platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine tubular pores; 30 percent pebbles; neutral (pH 7.0) clear smooth boundary.

A2--3 to 10 inches; brown (10YR 5/3) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, and common medium roots; many fine and few medium tubular pores; 30 percent pebbles; neutral (pH 7.2); clear smooth boundary.

Bt1--10 to 14 inches; brown (7.5YR 5/4) very gravelly clay loam, dark brown (7.5YR 3/4) moist; moderate medium and coarse subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; many fine and few medium roots; common fine and few very fine tubular pores; many moderately thick clay films lining pores, bridging mineral grains on faces of peds and as colloid stains; 50 percent pebbles; neutral (pH 7.2); gradual smooth boundary.

Bt2--14 to 20 inches; brown (7.5YR 5/4) very gravelly sandy clay loam, dark brown (7.5YR 3/4) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; many fine and few medium roots; few very fine and common fine tubular pores; common thin clay films as colloid stains, bridging mineral grains and lining pores; 50 percent pebbles and 5 percent cobbles; neutral (pH 7.2); clear smooth boundary.

Bt3--20 to 31 inches; brown (7.5YR 5/4) extremely gravelly sandy clay loam, dark brown (7.5YR 4/4) moist; massive; hard, firm, slightly sticky and moderately plastic; common fine and medium roots; few very fine and common fine tubular pores common thin clay films as colloidal stains, bridging mineral grains and on faces of peds; 60 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.4); gradual smooth boundary.

Bt4--31 to 39 inches; light reddish brown (5YR 6/3) extremely gravelly sandy clay loam, reddish brown (5YR 4/4) moist; massive; hard, firm, slightly sticky and moderately plastic; few fine roots; few very fine and common fine tubular pores; few thin clay films as colloid stains and bridging mineral grains; 60 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.4); gradual smooth boundary.

Bt5--39 to 60 inches; light reddish brown (5YR 6/3) very gravelly sandy clay loam, reddish brown (5YR 4/4) moist; massive; hard, firm, slightly sticky and moderately plastic; few very fine and common fine tubular pores; few thin clay films as colloid stains and bridging mineral grains, 40 percent pebbles and 15 percent cobbles; slightly alkaline (pH 7.4).

Type location: Elko County, Nevada; about 5 miles east of the O'Neil Basin; about 100 feet north and 200 feet west of the southeast corner of section 32, T. 45 N., R. 62 E.; (41 degrees, 44 minutes, 33 seconds north latitude and 114 degrees, 58 minutes, 21 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry mid-July through October.

Soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 10 to 20 inches.

Depth to base of argillic horizon: 40 to 60 inches.

Control section:

Clay content--20 to 35 percent.

Reaction--Neutral or slightly alkaline.

Rock fragments--40 to 70 percent, dominantly pebbles.

A horizons:

Value--3 through 5 dry, 2 through 4 moist.

Chroma--1 through 3.

Bt horizons:

Hue--10YR, 7.5YR or 5YR.

Value--3 through 5 moist, 5 or 6 dry.

Chroma--3 through 6 dry, 3 or 4 moist.

Texture--Very gravelly sandy clay loam, extremely gravelly sandy clay loam or very gravelly clay loam with less than 35 percent silt.

Clay content--20 to 35 percent.

Rock fragments--40 to 70 percent, dominantly pebbles.

Structure--Very fine, fine or medium subangular blocky or massive.

Pernty Series

The Pernty series consists of shallow, well drained soils that formed in residuum and some colluvium derived from mixed rocks. Pernty soils are on mountains and hills. Slopes are 15 to 50 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy-skeletal, mixed frigid Lithic Argixerolls

Typical pedon: Pernty very gravelly loam, 15 to 50 percent slopes, is located in an area of map unit 631. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles and 2 percent cobbles.

A--0 to 3 inches; brown (10YR 5/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine interstitial pores and few fine tubular pores; 45 percent pebbles; neutral (pH 7.3); clear wavy boundary.

Bt1--3 to 9 inches; brown (10YR 5/3) very gravelly clay loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; common very fine and few medium roots; common very fine interstitial pores; few thin clay films on faces of peds; 35 percent pebbles and 5 percent cobbles; neutral (pH 7.3); clear wavy boundary.

Bt2--9 to 16 inches; yellowish brown (10YR 5/4) very gravelly clay loam, dark yellowish brown (10YR 3/4) moist; moderate fine subangular blocky structure; hard, firm, very sticky and very plastic; few very fine roots; common very fine interstitial pores; many thick clay films on faces of peds and lining pores; 50 percent pebbles and 5 percent cobbles; neutral (pH 7.3); abrupt wavy boundary.

R--16 to 20 inches; fractured sandstone with many moderately thick clay films coating the bedrock surface with approximately 10 percent soil between fractures.

Type location: Elko County, Nevada; approximately 13 miles north of Cobre; about 2,800 feet north and 500 feet west of the southeast corner of section 25, T. 40 N., R. 67 E.; (41 degrees, 19 minutes, 30 seconds north latitude and 114 degrees, 20 minutes, 12 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in some part from late October through early June and is dry for 90 to 120 consecutive days.

Soil temperature: 42 to 47 degrees.

Average summer soil temperature: 59 to 64 degrees F.

Mollic epipedon thickness: 7 to 10 inches, includes the upper Bt horizon.

Depth to base of Bt horizon: 14 to 20 inches.

Depth to lithic contact: 14 to 20 inches.

Control section:

Clay content--25 to 35 percent, when mixed.

Rock fragments--35 to 50 percent when mixed, mainly pebbles or cobbles.

A horizon:

Chroma--2 or 3.

Bt horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 through 4.

Texture--Very gravelly clay loam, very gravelly loam or very cobbly clay loam.

Structure--Weak or moderate subangular blocky or is massive.

Pibler Series

The Pibler series consists of shallow, well drained soils that formed in alluvium derived from mixed rocks. Pibler soils are on fan remnants. Slopes are 2 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 52 degrees F.

Taxonomic class: Loamy-skeletal, mixed, mesic, shallow Xerollic Paleorthids

Typical pedon: Pibler very gravelly fine sandy loam, 2 to 8 percent slopes, is located in an area of map unit 1052. (Colors are for dry soil unless

otherwise noted.) The soil surface is partially covered with 50 percent pebbles.

A--0 to 3 inches; light brownish gray (10YR 6/2) very gravelly fine sandy loam, brown (10YR 4/3) moist; weak thick platy structure; slightly hard, very friable, nonsticky and nonplastic; common very fine roots; many very fine and fine vesicular pores; 35 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

Bk--3 to 10 inches; light gray (10YR 7/2) very gravelly loam, brown (10YR 5/3) moist; weak fine and medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; many very fine and few fine roots; common very fine interstitial pores; very thin lime coats on pebbles, thin lime pendants on undersides of pebbles; 45 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

Bkm1--10 to 26 inches; white (10YR 8/1) indurated lime hardpan with a continuous thin, 1 to 3 mm thick lamella, light gray (10YR 7/2) moist; massive; very rigid; violently effervescent; strongly alkaline (pH 8.6); clear wavy boundary.

Bkm2--26 to 48 inches; white (10YR 8/1) continuous strongly lime cemented hardpan with alternating layers of weakly lime cemented extremely gravelly loamy sand, light gray (10YR 7/2) moist; massive; extremely hard, slightly rigid; violently effervescent; strongly alkaline (pH 8.6); abrupt wavy boundary.

3Ck--48 to 61 inches; very pale brown (10YR 7/3) extremely gravelly sand, yellowish brown (10YR 5/4) moist; massive; hard; firm, nonsticky and nonplastic; many very fine interstitial pores; discontinuous weak lime cementation; 75 percent pebbles; violently effervescent; strongly alkaline (pH 8.6).

Type location: Elko County, Nevada; approximately 6 miles east of Montello; about 50 feet west and 15 feet south of the northeast corner of section 19, T. 39 N., R. 70 E.; (41 degrees, 15 minutes, 21 seconds north latitude and 114 degrees, 04 minutes, 48 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry mid June through October.

Soil temperature: 53 to 57 degrees F.

Depth to petrocalcic horizon: 7 to 20 inches.

Carbonates--Averages 20 to 40 percent between a depth of 10 inches and the petrocalcic horizon.

Reaction--Moderately alkaline to strongly alkaline.

A horizon:

Value--5 through 7 dry, 3 or 4 moist.

Chroma--2 through 4.

Bk horizon:

Value--6 through 8 dry, 4 through 6 moist.

Chroma--2 through 4.

Textures--Very gravelly loam or very gravelly fine sandy loam.

Consistence--Soft through hard dry.

Bkm horizon:

Value--7 or 8 dry, 5 through 7 moist.

Chroma--1 through 4.

Structure--Platy or it is massive.

Other features--Lamella is absent in some pedons.

Player Series

The Player series consists of very deep, well drained soils that formed in colluvium derived from welded tuff. Player soils are on mountains. Slopes are 30 to 50 percent. The mean annual precipitation is about 14 inches, and the mean annual temperature is about 44 degrees.

Taxonomic class: Clayey-skeletal, montmorillonitic, frigid Ultic Palexerolls

Typical pedon: Player gravelly loam, 30 to 50 percent slopes, is located in an area of map unit 3040. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 50 percent pebbles and 10 percent cobbles.

A--0 to 10 inches; dark grayish brown (10YR 4/2) gravelly loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; many very fine tubular pores; 20 percent pebbles; neutral (pH 7.1); abrupt wavy boundary.

Bt1--10 to 22 inches; brown (7.5YR 5/4) extremely gravelly clay, dark brown (7.5YR 3/4) moist; strong very fine subangular blocky structure; hard, firm, very sticky and very plastic; common very fine, fine, and medium roots; few very fine tubular pores; common moderately thick clay films on faces of peds and lining pores; 50 percent pebbles and 15 percent cobbles; neutral (pH 7.1); clear smooth boundary.

Bt2--22 to 47 inches; brown (7.5YR 5/4) extremely gravelly clay, dark brown (7.5YR 4/4) moist; strong medium angular blocky structure; slightly hard, firm, very sticky and very plastic; few very fine, fine, and medium roots; few very fine tubular pores; common moderately thick clay films on faces of peds and lining pores; 55 percent pebbles and 15 percent cobbles; neutral (pH 7.3); clear smooth boundary.

Bt3--47 to 62 inches; light brown (7.5YR 6/4) very gravelly clay loam, dark brown (7.5YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, firm, very sticky and moderately plastic; few very fine roots; few very fine tubular pores; few thin clay films on faces of peds and lining pores; 45 percent pebbles and 5 percent cobbles; neutral (pH 7.3).

Type location: Elko County, Nevada; approximately 7 miles west of Jackpot; about 500 feet east and 500 feet north of the southwest corner of section 3, T. 47 N., R. 63 E.; (41 degrees, 59 minutes, 07 seconds north latitude and 114 degrees, 49 minutes, 55 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; dry from about mid-July through mid-October.

Soil temperature: 42 to 45 degrees F.

Mollic epipedon thickness: 10 to 20 inches.

Base saturation: 55 to 65 percent, in the upper 30 inches.

Control section:

Clay content--45 to 60 percent.

Reaction--Slightly acid or neutral.

Rock fragments--45 to 75 percent, mainly pebbles.

A horizon:

Hue--10YR or 7.5YR.

Value--3 through 5 dry, 2 through 4 moist.

Chroma--1 or 2 dry or moist.

Bt horizons:

Hue--10YR or 7.5YR.

Value--3 through 6 dry, 2 through 4 moist.

Chroma--2 through 4 dry or moist.

Textures--Very gravelly clay, extremely gravelly clay.

Structure--Strong or moderate, very fine to medium, angular blocky or subangular blocky.

Some pedons have very gravelly clay loam in the lower part of the Bt horizon.

Puett Series

The Puett series consists of shallow, well drained soils formed in residuum and colluvium derived from mixed rocks. Puett soils are on hills, pediments, fan remnants. Slopes are 4 to 50 percent. The mean annual precipitation is about 9 inches and mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy, mixed (calcareous), mesic, shallow Xeric Torriorthents

Typical pedon: Puett gravelly sandy loam, 15 to 50 percent slopes, is located in an area of map unit 685. (Colors are for dry soils unless otherwise noted.) The soil surface is partially covered with 50 percent pebbles.

A--0 to 3 inches; light brownish gray (2.5Y 6/2) gravelly sandy loam, grayish brown (2.5Y 5/2) moist; weak thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine and fine interstitial vesicular pores; 25 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

C1--3 to 6 inches; light brownish gray (2.5Y 6/2) gravelly sandy loam, light olive brown (2.5Y 5/4) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine, and few medium roots; many very fine interstitial pores; 30 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

C2--6 to 11 inches; light gray (2.5Y 7/2) gravelly loam, light brownish gray (2.5Y 6/2) moist; massive; slightly hard, very friable, slightly

sticky and slightly plastic; common very fine, fine, and few medium roots; common very fine irregular pores; 30 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

Cr--11 to 20 inches; soft weathered tuff rock with gravels in place that are unweathered.

Type location: Elko County, Nevada; approximately 32 miles north of Wells in an unsectionalized area of T. 42 N., R. 63 E.; (41 degrees, 31 minutes, 04 seconds north latitude and 114 degrees, 48 minutes, 10 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring, dry June through October.

Soil temperature: 47 to 52 degrees F.

Depth to bedrock: 10 to 20 inches.

Control section:

Clay content--5 to 10 percent.

Reaction--Moderately alkaline or strongly alkaline.

Effervescence--Strongly effervescent or violently effervescent, throughout. Lime coats on pebbles in lower part of some pedons.

Rock fragments--Up to 35 percent pebbles.

A horizon:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 through 4.

C horizons:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 through 6 moist.

Chroma--2 through 4.

Texture of fine earth--Loamy fine sand to loam but is dominantly coarse sandy loam to loam. Gravelly loam or gravelly sandy loam is common in some pedons.

Structure--Subangular blocky or massive.

Quarz Series

The Quarz series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from mixed rocks. Quarz soils are on hills. Slopes are 4 to 50 percent. The mean

annual precipitation is about 12 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, frigid Aridic Argixerolls

Typical pedon: Quarz very gravelly loam, 4 to 15 percent slopes, is located in an area of map unit 232. (Colors are for dry soils unless otherwise noted.). The soil surface is partially covered with 45 percent pebbles and 5 percent cobbles.

A1--0 to 3 inches; brown (10YR 5/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine, fine, medium vesicular, and few fine tubular pores; 40 percent pebbles and 5 percent cobbles; neutral (pH 7.2); clear smooth boundary.

Bt1--3 to 9 inches; brown (10YR 5/3) very gravelly clay loam, dark brown (10YR 3/3) moist; moderate, medium subangular blocky structure; hard, friable, very sticky and moderately plastic; many very fine, fine, and few medium roots; many very fine and fine tubular pores; common moderately thick clay films lining pores, bridging mineral grains and on faces of peds; 30 percent pebbles and 5 percent cobbles; neutral (pH 7.2); clear smooth boundary.

Bt2--9 to 14 inches; yellowish brown (10YR 5/4) very gravelly clay, dark yellowish brown (10YR 4/4) moist; moderate, medium subangular blocky structure; hard, firm, very sticky and very plastic; common very fine and few fine roots; common fine tubular pores; many thick clay films lining pores, bridging mineral grains and on faces of peds; 40 percent pebbles and 10 percent cobbles; neutral (pH 7.2); clear smooth boundary.

Bt3--14 to 23 inches; yellowish brown (10YR 5/4) extremely gravelly clay, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky; hard, firm, very sticky and very plastic; few fine roots; common fine tubular pores; many thick clay films lining pores, bridging mineral grains and on faces of peds; few medium soft lime masses and threads; 45 percent pebbles and 25 percent cobbles; neutral (pH 7.0); abrupt wavy boundary.

R--23 inches; highly fractured welded tuff.

Type location: Elko County, Nevada; approximately 4 miles northwest of the O'Neil Basin; about 1,000 feet south and 1,000 feet west of the northeast corner of section 3, T. 45 N., R. 61 E.; (41 degrees, 49 minutes, 19 seconds north latitude and 115 degrees, 03 minutes, 10 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry late July through October.

Soil temperature: 44 to 47 degrees F.

Depth to bedrock: 20 to 40 inches.

Thickness of mollic epipedon: 7 to 16 inches which includes the upper part of the argillic horizon in some pedons.

Control section:

Clay content--35 to 55 percent.

Rock fragments--35 to 60 percent, mainly pebbles with up to 15 cobbles.

Reaction--Neutral or slightly alkaline.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Hue--5YR, 7.5YR or 10YR.

Value--4 through 6 dry, 3 or 4 moist.

Chroma--3 through 5.

Texture--Dominantly very gravelly clay loam or very gravelly clay with very cobbly clay loam or extremely gravelly clay common in some subhorizons.

Structure--Subangular blocky, angular blocky or prismatic.

Quopant Series

The Quopant series consists of shallow, well drained soils that formed in colluvium and residuum from volcanic rocks. The Quopant soils are on hills and mountains. Slopes are 15 to 75 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid, shallow Typic Argixerolls

Typical pedon: Quopant very gravelly sandy loam, 30 to 75 percent slopes, is located in an area of map unit 748. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles and 15 percent cobbles.

A--0 to 5 inches; grayish brown (10YR 5/2) very gravelly sandy loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine tubular pores; 30 percent pebbles and 10 percent cobbles; neutral (pH 7.2); clear smooth boundary.

Bt1--5 to 11 inches; brown (10YR 5/3) very gravelly sandy clay loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and moderately plastic; many very fine, fine, and few medium roots; common fine tubular pores; few thin clay films as colloid stains and bridging mineral grains; 35 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.6); clear smooth boundary.

Bt2--11 to 14 inches; pale brown (10YR 6/3) very gravelly sandy clay loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; slightly hard, very friable, moderately sticky and moderately plastic; many very fine, fine, and few medium roots; common fine tubular and many very fine interstitial pores; few thin clay films as colloidal stains and bridging mineral grains; few very thin lime and silica coats on undersides of pebbles; 35 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

2C--14 to 18 inches; pale brown (10YR 6/3) sandy loam, dark grayish brown (10YR 4/2) moist; massive; slightly hard, friable, nonsticky and nonplastic; common fine roots; many very fine interstitial pores; 20 percent very soft tuff fragments; slightly alkaline (pH 7.6); abrupt wavy boundary.

2Cr--18 inches; highly weathered ash flow tuffs.

Type location: Elko County, Nevada; approximately 9 miles southwest of Contact; about 1,500 feet north and 750 feet east of the southwest corner of section 36 T. 45 N., R. 62 E.; (41 degrees, 44 minutes, 50 seconds north latitude

and 114 degrees, 54 minutes, 39 west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, but are dry from July through October, moist in the winter and spring.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 9 to 14 inches, includes upper part of the Bt horizon.

Depth to paralithic contact: 14 to 20 inches.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Value--5 or 6 dry, 3 or 4 moist with darker value common to the upper subhorizon.

Chroma--2 or 3.

Texture--Very gravelly loam, very gravelly clay loam or very gravelly sandy clay loam.

Clay content--18 to 30 percent.

Rock fragments--35 to 50 percent, mainly pebbles that are larger than 5 millimeter.

Structure--Fine to coarse subangular blocky.

2C horizon:

Value--5 or 6 dry; 3 or 4 moist.

Chroma--2 or 3.

Texture--Sandy loam or loam.

Rock fragments--10 to 20 percent soft tuff fragments.

Rodie Series

The Rodie series consists of very deep, moderately well drained soils that formed in colluvium derived from pyroclastic and volcanic rocks. The Rodie soils are on hills and mountains. Slopes are 4 to 75 percent. The mean annual precipitation is about 13 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid
Aridic Duric Haploxerolls

Typical pedon: Rodie very gravelly loam, 15 to 50 percent slopes, is located in an area of map unit 420. (Colors are for dry soil unless otherwise

noted.) The soil surface is partially covered with 55 percent pebbles and 10 percent cobbles.

A1--0 to 2 inches; light brownish gray (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine, fine, and few medium roots; many very fine and few fine tubular pores; 50 percent pebbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

A2--2 to 6 inches; brown (10YR 5/3) very gravelly silt loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; common very fine, fine, and few medium roots; many very fine and few fine tubular pores; 35 percent pebbles; slightly alkaline (pH 7.6); clear smooth boundary.

A3--6 to 14 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; common very fine, fine, and few medium roots; many very fine, few fine, and medium tubular pores; 50 percent pebbles; slightly alkaline (pH 7.8); abrupt irregular boundary.

Bw--14 to 26 inches; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; common fine and medium faint grayish brown (10YR 5/2) mottles; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; many very fine, few fine, and medium tubular pores; 50 percent pebbles; slightly alkaline (pH 7.8); clear wavy boundary.

Bqk1--26 to 30 inches; light yellowish brown (10YR 6/4) very gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; massive; hard, firm, slightly sticky and slightly plastic; few very fine roots; few very fine tubular pores; many very fine manganese nodules; many very thin silt coats lining pores, on faces of peds and on rock fragments; 50 percent weak discontinuous silica cementation; few thin lime and silica pendants on the undersides of rock fragments; 50 percent pebbles and 5 percent cobbles; slightly effervescent; moderately alkaline (pH 8.0); abrupt smooth boundary.

Bqk2--30 to 34 inches; very pale brown (10YR

Elko County, Nevada, Northeast Part--Part I

7/3) extremely gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; massive; hard, firm and brittle, nonsticky and nonplastic; few very fine roots; few very fine tubular pores; many very fine manganese nodules; many very thin silt coats lining pores; many thin to moderately thick lime and silica pendants on the undersides of rock fragments; common fine soft masses of lime, and few very fine seams and filaments of lime; 50 percent pebbles and 20 percent cobbles; continuous brittle matrix; strongly effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

Bqk3--34 to 39 inches; very pale brown (10YR 7/3) extremely gravelly sandy loam, yellowish brown (10YR 5/4) moist; massive; hard, firm and brittle, nonsticky and nonplastic; few very fine roots; common very fine and fine tubular pores; many very fine manganese nodules; many very thin silt coats lining pores; common thin to moderately thick lime and silica pendants on the undersides of rock fragments; common fine soft masses of lime, and few very fine seams and filaments of lime; 55 percent pebbles and 10 percent cobbles; continuous brittle matrix; strongly effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

Bqk4--39 to 60 inches; very pale brown (10YR 7/3) extremely gravelly loamy coarse sand, brown (10YR 4/3) moist; massive; hard, firm, nonsticky and nonplastic; few very fine roots; many very fine manganese nodules; common thin to moderately thick lime and silica pendants on the undersides of rock fragments; 55 percent pebbles and 10 percent cobbles; continuous brittle matrix; strongly effervescent; moderately alkaline (pH 8.2).

Type location: Elko County, Nevada; approximately 6 miles northwest of Contact; about 660 feet east and 1,320 feet north of the southwest corner of section 34 T. 46 N., R. 63 E.; (41 degrees, 49 minutes, 35 seconds north latitude and 114 degrees, 49 minutes, 40 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, and dry from July through October for 90 to 120 consecutive days.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 10 to 15 inches.

Depth to carbonates: 12 to 39 inches.

Depth to continuous brittle matrix: 21 to 39 inches.

Control section:

Clay content--Averages 15 to 25 percent.

Rock fragments--50 to 70 percent, dominantly pebbles.

A horizons:

Value--5 or 6 dry, 3 or 4 moist. When the upper 7 inches are mixed, the value is darker than 5.5, and 3.5 moist.

Chroma--2 or 3.

Reaction--Neutral or slightly alkaline.

Bw horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Texture--Very gravelly loam or very gravelly sandy loam.

Clay content--15 to 25 percent.

Rock fragments--50 to 60 percent pebbles.

Mottles--None to common.

Bqk horizons:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 through 4.

Texture--Very gravelly loam, very gravelly sandy loam, or extremely gravelly sandy loam with extremely gravelly loamy coarse sand or sandy loam common in the lower subhorizons.

Clay content--15 to 25 percent.

Rock fragments--50 to 70 percent, mainly pebbles.

Structure--Weak subangular blocky or it is massive.

Reaction--Moderately alkaline or strongly alkaline.

Manganese nodules--Common or many.

Silt coats--Commonly line pores in most of the upper subhorizons.

Other features--Continuous brittle matrix and discontinuously lime cemented in some subhorizon above 40 inches with up to 30 percent durinodes common in any subhorizon.

Scalfar Series

The Scalfar series consists of very deep, well drained soils that formed in colluvium derived from pyroclastic and volcanic rocks. The Scalfar soils

are on mountains, hills, and fan remnants. Slopes are 4 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 41 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Calcic Argixerolls

Typical pedon: Scalfar very gravelly loam, 15 to 50 percent slopes, is located in an area of map unit 651. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 35 percent pebbles and 5 percent cobbles.

A--0 to 2 inches; dark grayish brown (10YR 4/2) very gravelly loam, very dark brown (10YR 2/2) moist; weak thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, and few medium roots; many very fine vesicular and common fine tubular pores; 30 percent pebbles and 5 percent cobbles; slightly alkaline (pH 7.6); abrupt wavy boundary.

Bt1--2 to 5 inches; brown (10YR 5/3) very gravelly clay loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; many very fine, fine, and few medium roots; common very fine and fine tubular pores; many thin clay films lining pores, bridging mineral grains and as colloid stains on mineral grains; 45 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.8); clear wavy boundary.

Bt2--5 to 11 inches; brown (10YR 5/3) very gravelly clay loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; many very fine, fine, and few medium roots; common very fine and fine tubular pores; many thin clay films lining pores, bridging mineral grains and as colloid stains on mineral grains; 45 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.8); gradual wavy boundary.

2Bw--11 to 25 inches; pale brown (10YR 6/3) extremely cobbly loam, brown (10YR 4/3) moist; moderate very fine and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and few medium roots; many very fine and fine tubular pores; many silt coats on rock fragments; 45 percent pebbles and 25 percent

cobbles; slightly alkaline (pH 7.8); clear wavy boundary.

2Bk1--25 to 37 inches; pale brown (10YR 6/3) extremely cobbly sandy loam, brown (10YR 4/3) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; many very fine and fine tubular pores; many thin lime and silica coats on undersides of pebbles; common fine and medium soft lime masses; 45 percent pebbles and 25 percent cobbles; violently effervescent in spots in a slightly effervescent matrix; moderately alkaline (pH 7.9); clear wavy boundary.

2Bk2--37 to 60 inches; pale brown (10YR 6/3) extremely cobbly coarse sandy loam, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and slightly plastic; few very fine roots; many very fine and fine tubular pores; many fine, medium and coarse soft lime masses; many moderately thick lime coats on pebbles and cobbles; 35 percent pebbles and 40 percent cobbles; violently effervescent; moderately alkaline (pH 8.4).

Type location: Elko County, Nevada; approximately 27 miles north of Wells; about 2,000 feet south and 800 feet east of the northwest corner of section 36, T. 43 N., R. 61 E.; (41 degrees, 34 minutes, 37 seconds north latitude and 115 degrees, 01 minutes, 37 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, dry from July to October, moist in late fall through early summer.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 10 to 14 inches, includes the argillic horizon.

Depth to calcic horizon: 21 to 35 inches.

Depth to 2Bw horizon: 10 to 14 inches.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Value--4 or 5 dry.

Chroma--2 or 3.

Clay content--27 to 35 percent.

Rock fragments--35 to 60 percent, mainly pebbles.

Reaction--Slightly alkaline or moderately alkaline.

2Bw horizon:

Texture--Very cobbly or extremely cobbly loam.

Clay content--10 to 20 percent.

Reaction--Slightly alkaline or moderately alkaline.

2Bk horizon:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 through 4.

Texture--Extremely cobbly sandy loam, or extremely cobbly coarse sandy loam.

Clay content--8 to 18 percent.

Rock fragments--60 to 80 percent, mainly cobbles and pebbles.

Reaction--Moderately alkaline or strongly alkaline.

Shafter Series

The Shafter series consists of shallow to an indurated limepan, well drained soils that formed in alluvium derived from limestone, dolomite, loess, and volcanic ash. The Shafter soils are on fan remnants. Slopes are 2 to 8 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy, mixed, mesic, shallow Typic Paleorthids

Typical pedon: Shafter gravelly loam, 2 to 8 percent slopes, is located in an area of map unit 1040. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 20 percent pebbles.

A--0 to 3 inches; light yellowish brown (10YR 6/4) gravelly loam, dark grayish brown (10YR 4/2) moist; moderate thin platy structure; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; many very fine and common fine vesicular pores; 15 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

Bk--3 to 14 inches; light gray (10YR 7/2) gravelly very fine sandy loam, brown (10YR 5/3) moist; weak medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common very fine and many fine

roots; many very fine and few fine interstitial pores; common thin lime pendants on undersides of rock fragments; 20 percent pebbles; violently effervescent; strongly alkaline (pH 8.6); abrupt smooth boundary.

Bkm--14 to 30 inches; white (10YR 8/2) indurated lime-cemented hardpan with some accessory silica cementation; light yellowish brown (10YR 6/4) moist; massive; very rigid; violently effervescent; abrupt wavy boundary.

2Ck--30 to 61 inches; white (10YR 8/2) stratified sandy loam to very gravelly coarse sand, light yellowish brown (10YR 6/4) moist; alternating lenses and layers of up to 60 percent discontinuous 1/4 to 1 inch thick strong lime cementation; single grain; loose; nonsticky and nonplastic; many thin lime pendants on undersides of pebbles; averages 55 percent pebbles; violently effervescent; strongly alkaline (pH 8.5).

Type location: Elko County, Nevada; approximately 4 miles east of Montello; about 80 feet south and 450 feet east of the northwest corner of section 24, T. 39 N., R. 69 E.; (41 degrees, 15 minutes, 22 seconds north latitude and 114 degrees, 06 minutes, 58 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry late May through early November.

Soil temperature: 53 to 59 degrees F.

Depth to indurated petrocalcic horizon: 10 to 20 inches.

Control section:

Clay content--8 to 18 percent.

Rock fragments--15 to 35 percent, mainly pebbles.

Reaction--Moderately alkaline or strongly alkaline.

Effervescence--Strongly effervescent or violently effervescent.

Calcium carbonate equivalent--Averages 15 to 30 percent for the less than 20 millimeter fraction above the petrocalcic horizon.

A horizon:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--3 or 4 dry, 2 or 3 moist.

Bk horizon:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.
 Texture--Gravelly very fine sandy loam, gravelly loam or gravelly silt loam.
 Clay content--8 to 18 percent.
 Rock fragments--15 to 35 percent mainly pebbles.
 Structure--Weak or moderate subangular blocky, or is massive.
 Lime pendants--Thin or moderately thick.

Bkm horizons:

Value--7 or 8 dry, 6 or 7 moist.
 Chroma--2 through 4.

2Ck horizons:

Value--7 or 8 dry, 5 or 6 moist.
 Chroma--2 through 4.
 Texture--Stratified sandy loam to extremely gravelly coarse sand.
 Clay content--0 to 8 percent.
 Rock fragments--45 to 75 percent, mainly pebbles.
 Lime cementation--Weak to strong, 30 to 70 percent discontinuous lenses or layers.

Shalclev Series

The Shalclev series consists of very shallow and shallow, well drained soils that formed in residuum and colluvium derived from mixed rocks. The Shalclev soils are on hills and mountains. Slopes are 4 to 75 percent. The mean annual precipitation is about 16 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Lithic Argixerolls

Typical pedon: Shalclev extremely gravelly silt loam, 4 to 15 percent slopes, is located in an area of map unit 420. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 60 percent pebbles and 5 percent cobbles.

A1--0 to 1 inch; grayish brown (10YR 5/2) extremely gravelly silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium and thick platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine and medium roots; many very fine and fine vesicular pores; 60 percent pebbles and 5

percent cobbles; neutral (pH 7.2) abrupt wavy boundary.

A2--1 to 4 inches; grayish brown (10YR 5/2) very gravelly silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and few medium roots; common very fine and fine tubular pores; 50 percent pebbles and 5 percent cobbles; neutral (pH 7.3); abrupt smooth boundary.

Bt1--4 to 9 inches; grayish brown (10YR 5/2) very channery silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; common very fine, fine and few medium roots; common very fine and fine tubular pores; few thin clay films on faces of peds; 5 percent pebbles, 25 percent channers, and 10 percent flagstones; neutral (pH 7.0); abrupt wavy boundary.

Bt2--9 to 12 inches; brown (10YR 5/3) extremely flaggy clay, dark brown (10YR 4/3) moist; moderate fine angular blocky structure; hard, firm, moderately sticky and moderately plastic; few very fine and fine roots; few very fine and fine tubular pores; few moderately thick clay films on faces of peds; 5 percent very soft rock fragments; 40 percent channers, 40 percent flagstones, and 5 percent stones; neutral (pH 6.8); abrupt smooth boundary.

R--12 inches; highly fractured, welded tuffs.

Type location: Elko County, Nevada; approximately 10 miles south of Jackpot; about 2,500 feet west and 2,000 feet north of the southeast corner of section 22, T. 46 N., R. 63 E.; (41 degrees, 51 minutes, 29 seconds north latitude and 114 degrees, 49 minutes, 18 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, dry from July to October for 70 to 100 consecutive days.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 4 to 12 inches, includes all or part of the Bt horizons.

Depth to bedrock: 4 to 12 inches.

Control section:

Clay content--Averages 28 to 35 percent.

Rock fragments--60 to 75 percent, mainly channers and flagstones.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.
Chroma--2 or 3.

Bt horizons:

Hue--7.5YR or 10YR.
Value--4 through 6 dry, 3 or 4 moist.
Chroma--2 through 4.
Texture--Very channery silt loam or very channery clay loam in the upper subhorizon and extremely channery clay loam, extremely channery clay or extremely flaggy clay in the lower subhorizon overlying the bedrock.
Clay content--30 to 40 percent.
Rock fragments--40 to 60 percent in the upper subhorizon and 60 to 85 percent in the lower subhorizons mainly channers and flagstones.
Structure--Subangular blocky or angular blocky.

fine tubular pores; 45 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt--9 to 12 inches; yellowish brown (10YR 5/4) very gravelly clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine and fine roots; common very fine tubular pores; 45 percent pebbles; 10 percent of pebbles have silica pendants on undersides; neutral (pH 7.0); abrupt wavy boundary.

R--12 inches; hard, fractured rhyolite.

Type location: Elko, County, Nevada; approximately 19 miles southeast of Jackpot; about 700 feet east and 500 feet south of the northwest corner of section 3, T. 45 N., R. 62 E.; (41 degrees, 49 minutes, 23 seconds north latitude and 114 degrees, 56 minutes, 30 seconds west longitude.)

Shalper Series

The Shalper series consists of very shallow and shallow, well drained soils that formed in residuum and colluvium derived from rocks. The Shalper soils are on hills and pediments. Slopes are 2 to 50 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Lithic Argixerolls

Typical pedon: Shalper very gravelly loam, 15 to 30 percent slopes, is located in an area of map unit 235. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 35 percent pebbles.

A1--0 to 5 inches; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common very fine, fine and medium roots; few very fine tubular pores; 35 percent pebbles; neutral (pH 6.8); clear wavy boundary.

A2--5 to 9 inches; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry from July through October for 70 to 100 consecutive days.

Soil temperature: 45 to 47 degrees F.

Mollic epipedon thickness: 4 to 12 inches.

Depth to bedrock: 4 to 12 inches.

Control section:

Clay content--18 to 28 percent.

Other features--In some pedons the mollic epipedon includes all of the Bt horizon and is underlain directly by rock.

Rock fragments--35 to 60 percent, mainly pebbles.

A horizons:

Value--5 or 6 dry, 3 or 4 moist; when the upper 7 inches are mixed, value is less than 5.5 dry and 3.5 moist.

Chroma--2 or 3.

Bt horizon:

Value--3 or 4 moist.

Chroma--3 or 4 moist.

Texture--Very gravelly loam or very gravelly clay loam.

Clay content--Averages 24 to 35 percent.

Rock fragments--35 to 60 percent, mainly pebbles.

Structure--Weak to moderate subangular blocky and angular blocky.

Other features--Some pedons have thin subhorizons of clay, modified by 35 to 65 percent rock fragments directly over bedrock.

Shivlum Series

The Shivlum series consists of very deep, well drained soils that formed in colluvium derived from sedimentary rocks. The Shivlum soils are on hills. Slopes are 4 to 15 percent. The mean annual precipitation is about 15 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Fine-silty, mixed, frigid Aridic Argixerolls

Typical pedon: Shivlum silt loam, 4 to 15 percent slopes, is located in an area of map unit 3017. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 10 percent pebbles.

A1--0 to 4 inches; grayish brown (10YR 5/2) silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine roots; common very fine and fine tubular pores; neutral (pH 7.1); clear wavy boundary.

A2--4 to 11 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine and few fine tubular pores; neutral (pH 7.2); clear wavy boundary.

Bt1--11 to 17 inches; brown (10YR 5/3) silty clay loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, few fine, and medium roots; common very fine and few fine tubular pores; few thin clay films on faces of peds and common thin clay films lining pores; neutral (pH 7.3); clear wavy boundary.

Bt2--17 to 30 inches; pale brown (10YR 6/3) silty clay loam, brown (10YR 4/3) moist; moderate medium angular blocky structure; hard, firm, very sticky and very plastic; few very fine and fine roots; common very fine and few fine interstitial, and tubular pores; common thin clay

films on faces of peds and lining pores; neutral (pH 7.2); clear wavy boundary.
2Bt3--30 to 60 inches; light yellowish brown (10YR 6/4) silty clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium angular blocky structure; hard, firm, very sticky and very plastic; many very fine and few fine interstitial pores; common thin clay films on faces of peds and lining pores; neutral (pH 7.2).

Type location: Elko County, Nevada; approximately 16 miles northeast of Wells; in an unsurveyed section of T. 38 N., R. 64 E.; (41 degrees, 10 minutes, 48 seconds north latitude and 114 degrees, 44 minutes, 06 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from late June through October.

Soil temperature: 45 to 47 degrees F.

Mollic epipedon thickness: 10 to 17 inches.

Includes the upper part of the argillic horizon.

Depth to the 2Bt horizon: 24 to 40 inches.

Combined A and Bt horizon thickness: 60 to 80 inches.

Control section:

Clay content--25 to 35 percent.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 through 4 dry or moist.

Structure--Prismatic, angular blocky, or subangular blocky.

Texture--Silt loam or silty clay loam in the upper part with clay loam common in the lower part.

Shuttle Series

The Shuttle series consists of deep or very deep, well drained soils that formed in alluvium derived from mixed rocks. The Shuttle soils are on fan skirts. Slopes are 2 to 8 percent. The mean annual precipitation is about 6 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Coarse-loamy, mixed (calcareous), mesic Durorthidic Torriorthents

Typical pedon: Shuttle silt loam, 2 to 8 percent slopes, is located in an area of map unit 2001. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 20 percent pebbles.

A1--0 to 3 inches; light brownish gray (10YR 6/2) silt loam, brown (10YR 4/3) moist; moderate very thin platy structure; slightly hard, friable, nonsticky and slightly plastic; few very fine and fine roots; many very fine and fine vesicular pores; 8 percent calcium carbonate equivalent; 10 percent pebbles; violently effervescent; strongly alkaline (pH 8.8); abrupt smooth boundary.

A2--3 to 6 inches; light gray (10YR 7/2) silt loam; brown (10YR 5/3) moist; weak very thin platy structure; soft, very friable, nonsticky and slightly plastic; common very fine and fine roots; common very fine interstitial pores; 10 percent calcium carbonate equivalent; 5 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Bk--6 to 19 inches; very pale brown (10YR 7/3) very fine sandy loam, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and slightly plastic; common very fine, fine and medium roots; few very fine interstitial pores; 14 percent calcium carbonate equivalent; 10 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Bqk1--19 to 28 inches; very pale brown (10YR 7/3) silt loam, light yellowish brown (10YR 6/4) moist; massive; hard, firm, nonsticky and nonplastic; few very fine interstitial pores; 10 percent, 5 to 10 millimeter hard, firm durinodes; 20 percent calcium carbonate equivalent; 5 percent pebbles; continuous brittle matrix; violently effervescent, moderately alkaline (pH 8.0); clear smooth boundary.

Bqk2--28 to 45 inches; very pale brown (10YR 7/3) silt loam, light yellowish brown (10YR 6/4) moist; massive; hard, firm, nonsticky and nonplastic; few very fine interstitial pores; 50 percent discontinuous weak silica cementation; 15 percent 5 to 10 millimeters durinodes; 18 percent calcium carbonate equivalent; 10 percent pebbles; violently effervescent; moderately alkaline (pH 8.0); abrupt smooth boundary.

Bqkm--45 to 60 inches; very pale brown (10YR 8/3) indurated duripan with several continuous 1 to 3 millimeters silica laminae banded throughout the horizon, with thick alternating layers of weakly cemented very gravelly sandy loam common, light yellowish brown (10YR 6/4) moist; very hard, very firm; violently effervescent; strongly alkaline (pH 8.5)

Type location: Elko County, Nevada; approximately 9 miles south of Montello about 2,000 feet east and 100 feet north of the southwest corner of section 14, T. 38 N., R. 69 E.; (41 degrees, 10 minutes, 08 seconds north latitude and 114 degrees, 08 minutes, 09 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry late May through early November.

Soil temperature: 53 to 57 degrees F.

Depth to continuous brittle matrix: 10 to 20 inches.

Depth to Bqkm horizon: 40 to over 80 inches when present.

Control section:

Clay content--8 to 15 percent.

Calcium carbonate equivalent--10 to 25 percent
Reaction--Moderately alkaline or strongly alkaline.

Other features--The Bqkm horizon is absent in some pedons.

Rock fragments--5 to 20 percent, mainly pebbles

A horizons:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Bk horizon:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--3 or 4.

Clay content--8 to 18 percent.

Structure--Massive or weak subangular blocky.

Texture--Silt loam, very fine sandy loam or gravelly silt loam

Bqk horizons:

Hue--10YR or 2.5Y.

Chroma--3 or 4.

Clay content--5 to 15 percent.

Cementation--Continuous brittle matrix are 7 to 15 inches thick. Discontinuous weak silica cemented subhorizons have up to 30 percent 5 to 15 millimeters durinodes.

Other features--Substratum of stratified fine sandy loam to very gravelly sandy loam is common in some pedons below 40 inches.

Simon Series

The Simon series consists of very deep, well drained soils that formed in loess over gravelly and alluvium derived from mixed rocks. Simon soils are on fan remnants. Slopes are 4 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Fine-loamy, mixed, frigid Aridic Argixerolls

Typical pedon: Simon silt loam, 4 to 15 percent slopes, is located in an area of map unit 291. (Colors are for dry soil unless otherwise noted.)

A1--0 to 3 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; strong thin platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots; common very fine interstitial pores; 5 percent pebbles; neutral (pH 7.2); clear smooth boundary.

A2--3 to 13 inches; grayish brown (10YR 5/2) silt loam, dark brown (10YR 3/3) moist; weak coarse subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine and few fine roots; common very fine, fine tubular and interstitial pores; 5 percent pebbles; neutral (pH 7.2); clear smooth boundary.

Bt1--13 to 24 inches; yellowish brown (10YR 5/4) gravelly clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; hard, firm, very sticky and very plastic; common very fine roots; many very fine and common fine interstitial pores; many thin clay films on faces of peds and lining pores; 15 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt2--24 to 43 inches; light yellowish brown (10YR 6/4) gravelly clay loam, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky

structure; hard, firm, moderately sticky and moderately plastic; common very fine and few fine roots; many very fine and fine tubular pores; common thin clay films on faces of peds and lining pores; 20 percent pebbles; neutral (pH 7.2); clear wavy boundary.

C--43 to 60 inches; light yellowish brown (10YR 6/4) gravelly loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and few fine roots; common very fine interstitial pores; 30 percent pebbles; neutral (pH 7.0).

Type location: Elko County, Nevada; approximately 10 miles north of Wells; about 50 feet east of the southwest corner of section 16, T. 39 N., R. 62 E.; (41 degrees, 15 minutes, 32 seconds north latitude and 114 degrees, 58 minutes, 51 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring, dry late June through October.

Soil temperature: 45 to 47 degrees F.

Mollic epipedon thickness: 10 to 17 inches, commonly including part of the argillic horizon.

Combined thickness of A and Bt horizons: 40 to 60 inches.

Control section:

Clay content--Averages 20 to 35 percent.

Reaction--Neutral or slightly acid.

Rock fragments--5 to 25 percent rock fragments, mainly pebbles.

A horizons:

Chroma--2 or 3.

Bt horizons:

Value--5 or 6 dry, 3 through 5 moist.

Chroma--2 through 4.

Texture--Loam, clay loam or gravelly clay loam in the upper part, cobbly clay loam, cobbly clay or gravelly clay loam in the lower part.

Structure--Weak or moderate, fine or medium subangular blocky or prismatic.

C horizons:

Value--5 or 6 dry, 4 or 5 moist.

Chroma--2 through 4.

Other features--Unconformable clay, or sand and gravel are below a depth of 40 inches in some pedons.

Snotown Series

The Snotown series consists of moderately deep, moderately well drained soils that formed in residuum and colluvium derived from sedimentary rocks. The Snotown soils are on hills and mountains. Slopes are 15 to 50 percent. The mean annual precipitation is about 16 inches and the mean annual temperature is about 41 degrees F.

Taxonomic class: Loamy-skeletal, mixed Dystric Cryochrepts

Typical pedon: Snotown very gravelly coarse sandy loam, 15 to 50 percent slopes, is located in an area of map unit 757. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 70 percent pebbles.

A--0 to 3 inches; light yellowish brown (10YR 6/4) very gravelly coarse sandy loam, dark brown (10YR 4/3) moist; weak thin platy structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine and common fine interstitial and tubular pores; 55 percent pebbles; very strongly acid (pH 4.6); clear wavy boundary.

Bw1--3 to 7 inches; light yellowish brown (10YR 6/4) very gravelly coarse sandy loam, dark brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and few fine roots; common very fine tubular pores; 55 percent pebbles; very strongly acid (pH 4.6); clear wavy boundary.

Bw2--7 to 24 inches; yellowish brown (10YR 5/4) very gravelly sandy loam, dark brown (10YR 4/3) moist; weak coarse subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine roots; common very fine and few fine tubular pores; 50 percent pebbles; very strongly acid (pH 4.5); clear wavy boundary.

C--24 to 30 inches; brownish yellow (10YR 6/6) extremely gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine roots; many fine and common very fine tubular pores; many very thin silt coats lining pores; 60 percent pebbles, 5 percent cobbles; extremely acid (pH 4.4); abrupt wavy boundary.

R--30 inches; hard, fractured shale, with many prominent dark brown (7.5YR 3/4) manganese coats on bedding plane surfaces.

Type location: Elko County, Nevada; approximately 21 miles north of Wells in the Snake Mountains; about 500 feet east and 150 feet south of the northwest corner of section 32, T. 41 N., R. 62 E.; (41 degrees, 24 minutes, 23 seconds north latitude and 114 degrees, 59 minutes, 22 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, dry from late August through October.

Additional soil moisture: Supplied by lateral water movement in the lower subhorizon above the bedrock.

Soil temperature: 38 to 45 degrees F.

Average summer soil temperature: 43 to 47 degrees F.

Combined thickness of the A and Bw horizons: 15 to 30 inches.

Depth to bedrock: 20 to 40 inches.

Base saturation: 5 to 15 percent.

Control section:

Percent clay--12 to 18 percent.

Rock fragments--40 to 65 percent pebbles, up to 5 percent cobbles.

A horizon:

Value--5 or 6 dry, 3 or 4 moist. When mixed, value of the upper 7 inches is greater than 5.5 dry and 3.5 moist.

Chroma--2 through 4.

Bw horizons:

Value--5 or 6 dry.

Chroma--3 or 4.

Structure--Weak or moderate subangular blocky.

Reaction--Very strongly acid or extremely acid.

C horizon:

Value--5 or 6 dry.

Chroma--3 through 6.

Texture--Very gravelly sandy loam, extremely gravelly sandy loam or very gravelly coarse sandy loam.

Structure--Subangular blocky or the horizon is massive.

Reaction--Very strongly acid or extremely acid.

Pores--Lined with very thin silt coats or uncoated mineral grains.

Sodhouse Series

The Sodhouse series consists of shallow, well-drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. These soils are on fan remnants. Slopes are 2 to 8 percent. The mean annual precipitation is about 7 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Loamy, mixed, mesic, shallow Typic Durorthids

Typical pedon: Sodhouse gravelly silt loam, 2 to 8 percent slopes, is located in an area of map unit 2040. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 40 percent pebbles.

A--0 to 3 inches; light gray (10YR 7/2) gravelly silt loam, brown (10YR 5/3) moist; strong very thick platy structure parting to weak thin platy; hard, friable, slightly sticky and slightly plastic; few very fine roots; many very fine and fine vesicular pores; 15 percent pebbles, moderately alkaline (pH 8.2); abrupt smooth boundary.

Bw--3 to 7 inches; very pale brown (10YR 7/3) gravelly loam, yellowish brown (10YR 5/4) moist; moderate fine subangular blocky structure; hard, friable, slightly sticky and slightly plastic; many very fine, fine, and few medium roots; many very fine and fine tubular pores; 15 percent pebbles; slightly effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Bk--7 to 14 inches; light yellowish brown (10YR 6/4) gravelly loam, yellowish brown (10YR 5/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; common fine and few medium roots; few fine interstitial pores; thick lime and silica coats on undersides of pebbles; violently effervescent; 30 percent pebbles; moderately alkaline (pH 8.4); abrupt smooth boundary.

Bqkm--14 to 38 inches; white (10YR 8/2) indurated duripan, very pale brown (10YR 7/3) moist; massive; very rigid; 1 to 2 millimeters continuous laminar cap alternating with strong

to weak silica and lime cementation; violently effervescent; clear wavy boundary.

2Bqk--38 to 61 inches; very pale brown (10YR 7/4) gravelly loam, yellowish brown (10YR 5/4) moist; massive; very hard, brittle, nonsticky and nonplastic; many fine interstitial pores; continuous brittle matrix; 30 percent pebbles; strongly alkaline (pH 8.6).

Type location: Elko County, Nevada; approximately 3 miles south of Montello; about 1,900 feet north of the southwest corner of section 13, T. 38 N., R. 68 E.; (41 degrees, 10 minutes, 03 seconds north latitude and 114 degrees, 14 minutes, 03 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist for short periods in winter and spring, dry from June through November.

Soil temperature: 47 to 53 degrees F.

Depth to indurated duripan: 14 to 20 inches.

Thickness of duripan: 10 to 30 inches.

Depth to 2Bqk horizon: 25 to 44 inches.

Control section:

Clay content--8 to 15 percent.

Reaction--Moderately alkaline or strongly alkaline usually increasing with depth.

Other features--Durinodes and lime accumulations are common in subhorizons immediately above the duripan of some pedons.

A horizon:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Other features--Normally noneffervescent, but some pedons are slightly effervescent due to lime recharge from dust.

Bw horizon:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--3 or 4.

Texture--Very fine sandy loam, fine sandy loam, loam or gravelly loam.

Rock fragments--5 to 35 percent, mainly pebbles.

Bqkm horizon:

Hue--10YR or 2.5Y.

Elko County, Nevada, Northeast Part--Part I

Value--6 through 8 dry, 4 through 7 moist.
Chroma--2 through 4.
Structure--Platy or is massive.

Bk or Bqk horizons:

Hue--10YR or 2.5Y.
Value--6 or 7 dry, 4 or 5 moist.
Chroma--3 or 4.
Texture--Extremely gravelly sandy loam, very gravelly loamy sand or gravelly loam.

Sondoa Series

The Sondoa series consists of very deep, well drained soils that formed in alluvium derived from mixed rocks and lacustrine sediments. The Sondoa soils are on lake plains. Slopes are 0 to 2 percent. The mean annual precipitation is about 6 inches and the mean annual temperature is about 53 degrees F.

Taxonomic class: Fine-silty, mixed (calcareous) mesic Typic Torriorthents

Typical pedon: Sondoa silt loam, 0 to 2 percent slopes, is located in an area of map unit 186. (Colors are for dry soil unless otherwise noted.)

- A--0 to 4 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; strong thick platy structure parting to strong thin platy; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; many very fine vesicular and few medium tubular pores; violently effervescent; strongly alkaline (pH 8.9); abrupt smooth boundary.
- C1--4 to 11 inches; light gray (2.5Y 7/2) silt loam, grayish brown (2.5Y 5/2) moist; moderate medium platy structure; slightly hard, very friable, moderately sticky and slightly plastic; many very fine and few fine roots; many very fine interstitial pores; violently effervescent; strongly alkaline (pH 9.0); clear smooth boundary.
- C2--11 to 17 inches; white (2.5Y 8/2) silt loam, light yellowish brown (2.5Y 6/4) moist; moderate medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine and fine roots; many very fine interstitial pores; violently effervescent; very strongly alkaline (pH 9.2); clear smooth boundary.

C3--17 to 32 inches; light gray (10YR 7/2) silt loam, grayish brown (10YR 5/2) moist; massive; slightly hard, very friable, moderately sticky and slightly plastic; few very fine roots; many very fine interstitial pores; violently effervescent, strongly alkaline (pH 8.6); clear wavy boundary.

2Cy--32 to 43 inches; light gray (10YR 7/2) silt loam, grayish brown (10YR 5/2) moist; massive; slightly hard, very friable, moderately sticky and slightly plastic; few very fine roots; many very fine interstitial pores; few fine gypsum filaments; violently effervescent; strongly alkaline (pH 8.5); clear wavy boundary.

2Cq--43 to 63 inches; light gray (10YR 7/2) silt loam, grayish brown (10YR 5/2) moist; common fine prominent dark brown (7.5YR 4/4) moist, relict mottles; moderate thin platy structure; hard, friable, moderately sticky and slightly plastic; few very fine roots; common very fine interstitial pores; 10 percent hard 5 to 10 millimeter durinodes; 30 percent brittle matrix; violently effervescent; strongly alkaline (pH 8.5).

Type location: Elko County, Nevada; approximately 2 miles southeast of Montello; about 1,200 feet west and 60 feet north of the southeast corner of section 16, T. 39 N., R. 69 E.; (41 degrees, 15 minutes, 28 seconds north latitude and 114 degrees, 09 minutes, 45 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the winter and spring, dry June through November.

Soil temperature: 53 to 57 degrees F.

Control section:

Percent clay--Averages 25 to 35 percent.

Reaction--Strongly alkaline and very strongly alkaline.

Calcium carbonate equivalent--4 to 12 percent.

Effervescence--Strongly effervescent or violently effervescent.

A horizon:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 3 through 5 moist. Buried A horizons near flood plain remnants commonly have the value of 3 moist and when rubbed, lighten to 4 moist.

Chroma--2 or 3.

Other features--Buried A horizons are common in some pedons.

C horizons:

Hue--10YR or 2.5Y.

Value--6 through 8 dry, 4 through 6 moist.

Chroma--2 through 4.

Texture--Stratified silt loam and silty clay loam.

Thin or very thin varves of fine sand are common in some pedons.

Clay content--25 to 35 percent.

Structure--Platy, prismatic, subangular blocky or horizon is massive.

SAR--Greater than 46.

Segregated lime--Soft masses of lime occur in subhorizons of some pedons.

Relict mottles--Are common in any subhorizon in the lower profile.

Other features--Some pedons have few gypsum filaments below 25 inches. Some pedons have weak discontinuous silica cementation or durinodes or both. Some pedons lack crustacean shells.

Sonoma Series

The Sonoma series consists of very deep, poorly drained soils that formed in silty alluvium derived from mixed rocks, loess, and volcanic ash.

Sonoma soils are on flood plains and stream terraces. Slopes are 0 to 2 percent. The mean annual precipitation is about 7 inches and the mean annual temperature is about 50 degrees F.

Taxonomic class: Fine-silty, mixed (calcareous), mesic Aeric Fluvaquents

Typical pedon: Sonoma silt loam, frequently flooded, 0 to 2 percent slopes, is located in an area of map unit 183. (Colors are for dry soil unless otherwise noted.)

A1--0 to 4 inches; light gray (2.5Y 7/2) silt loam, dark grayish brown (2.5Y 4/2) moist; strong thick platy structure; slightly hard, very friable, very sticky and slightly plastic; common very fine roots; common very fine interstitial pores; strongly effervescent; strongly alkaline (pH 8.6); abrupt smooth boundary.

A2--4 to 8 inches; light gray (10YR 7/2) silt loam, brown (10YR 4/3) moist; moderate thin platy structure; soft, very friable, slightly sticky and

slightly plastic; common very fine and fine roots; few very fine interstitial pores; strongly effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

AC--8 to 14 inches; light gray (2.5Y 7/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak thin platy structure; soft, very friable, moderately sticky and slightly plastic; common very fine, fine, and medium roots; common very fine and fine interstitial pores; strongly effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

C1--14 to 26 inches; light gray (2.5Y 7/2) silty clay loam, dark grayish brown (2.5Y 4/2) moist; moderate medium subangular blocky structure; slightly hard, very friable, very sticky and moderately plastic; common very fine and fine roots; many very fine tubular and interstitial pores; strongly effervescent; strongly alkaline (pH 8.6); clear smooth boundary.

C2--26 to 36 inches; light gray (10YR 7/2) silt loam, dark grayish brown (10YR 4/2) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; common very fine roots; few very fine interstitial pores; strongly effervescent; strongly alkaline (pH 8.6); clear smooth boundary.

C3--36 to 44 inches; light gray (10YR 7/2) silt loam, grayish brown (2.5Y 5/2) moist; common fine prominent dark yellowish brown (10YR 4/4) and brown (10YR 5/3) mottles, moist; massive; hard, friable, slightly sticky and slightly plastic; few very fine roots; few very fine interstitial pores; strongly effervescent; strongly alkaline (pH 8.6); clear smooth boundary.

Ab--44 to 54 inches; gray (10YR 5/1) silty clay loam, black (10YR 2/1) moist; few fine distinct brown (10YR 4/3) mottles, moist; weak very thin platy structure; hard, friable, very sticky and very plastic; few very fine interstitial pores; strongly effervescent; strongly alkaline (pH 8.6); clear smooth boundary.

Cg--54 to 60 inches; gray (5Y 6/1) silty clay loam, olive gray (5Y 4/2) moist; few fine distinct light olive gray (5Y 6/2) mottles, moist; massive; very hard, firm, very sticky and very plastic; few very fine interstitial pores; strongly effervescent; strongly alkaline (pH 8.6).

Type location: Elko County, Nevada; approximately 14 miles north of Montello in an unsurveyed area; about 1,400 feet west and 1,300 feet south of the northwest corner of section 6, T.

41 N., R. 69 E.; (41 degrees, 28 minutes, 07 seconds north latitude and 114 degrees, 12 minutes, 07 seconds west longitude.)

Range in Characteristics:

Soil moisture: Saturated during spring and early summer with the water table at depths below 40 inches during the remainder of the year, unless drained.

Soil temperature: 49 to 53 degrees F.

Control section:

Clay content--25 to 35 percent.

Texture--Stratified silt loam to silty clay loam with strata of clay or silty clay in some pedons.

Depth to buried A horizon--30 to 55 inches.

Some pedons lack buried A horizons.

Calcium carbonate equivalent--3 to 12 percent throughout the profile and is strongly effervescent or violently effervescent.

A horizons:

Hue--2.5Y or 10YR.

Value--6 or 7 dry, 3 through 5 moist.

Chroma--1 through 3.

Reaction--Moderately alkaline or very strongly alkaline; buried A horizons are moderately alkaline or strongly alkaline.

C horizons:

Hue--10YR to 5Y.

Value--6 through 8 dry, 3 through 6 moist.

Chroma--1 or 2. Subhorizons in some pedons have chroma of 3.

Structure--Platy or subangular blocky or the horizon is massive.

Reaction--Moderately alkaline through very strongly alkaline.

Other features--Fresh-water crustacean shells and 1/4 to 1/2 inch diameter lime concretions in most pedons.

Soughe Series

The Soughe series consists of shallow, well drained soils that formed in residuum and colluvium derived from volcanic rocks. Soughe soils are on pediments and hills. Slopes are 2 to 50 percent. Mean annual precipitation is about 9 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy-skeletal, mixed, mesic Lithic Xerollic Haplargids

Typical pedon: Soughe very gravelly coarse sandy loam, 2 to 8 percent slopes, is located in an area of map unit 252. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 35 percent pebbles and 5 percent cobbles.

A--0 to 4 inches; pale brown (10YR 6/3) very gravelly coarse sandy loam, dark brown (10YR 4/3) moist; moderate medium platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine vesicular pores; 35 percent pebbles; slightly alkaline (pH 7.8); abrupt smooth boundary.

Bt1--4 to 8 inches; pale brown (10YR 6/3) very gravelly clay loam, dark brown (10YR 4/3) moist; weak fine subangular blocky structure; slightly hard, very friable, moderately sticky and moderately plastic; many very fine and fine roots; many very fine tubular pores; common thin clay films bridging mineral grains; 50 percent pebbles; moderately alkaline (pH 8.2); clear smooth boundary.

Bt2--8 to 11 inches; pale brown (10YR 6/3) very gravelly sandy clay loam, dark yellowish brown (10YR 4/4) moist; weak very fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine tubular pores; common thin clay films on faces of peds and as colloid stains; 50 percent pebbles; moderately alkaline (pH 8.2); abrupt wavy boundary.

R--11 inches; welded tuff.

Type location: Elko County, Nevada; approximately 1/2 mile east of Jackpot; about 1,500 feet north and 500 feet west of the southeast corner of section 1, T. 47 N., R. 64 E.; (41 degrees, 59 minutes, 22 seconds north latitude and 114 degrees, 39 minutes, 19 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring, dry mid-June through October.

Soil temperature: 47 to 50 degrees.

Depth to bedrock: 10 to 20 inches.

Control section:

Clay content--25 to 35 percent.

Rock fragments--35 to 60 percent, mainly pebbles with 0 to 10 percent cobbles.
Reaction--Neutral to moderately alkaline.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Bt horizons:

Value--4 through 6 dry, 3 or 4 moist.

Chroma--3 or 4.

Texture--Very gravelly clay loam, very gravelly sandy clay loam, or very gravelly loam.

Structure--Weak to strong, very fine to very coarse subangular blocky or moderate to strong, medium angular blocky.

Stampede Series

The Stampede series consists of well drained soils that are moderately deep to an indurated duripan. These soils formed in alluvium derived from mixed rocks. Stampede soils are on fan remnants. Slopes are 2 to 15 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid
Aridic Durixerolls

Typical pedon: Stampede gravelly loam, 2 to 8 percent slopes, is located in an area of map unit 1140. (Colors are for dry soils unless otherwise noted.) The soil surface is partially covered with 5 percent pebbles.

A1--0 to 2 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; strong thick platy structure parting to moderate very thin platy; hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine interstitial pores; 15 percent pebbles; neutral (pH 6.8); abrupt smooth boundary.

A2--2 to 5 inches; dark grayish brown (10YR 4/2) silty clay loam, very dark grayish brown (10YR 3/2) moist; strong very thin platy structure; hard, very friable, moderately sticky and moderately plastic; common very fine and medium roots; many very fine interstitial pores; 5 percent pebbles; neutral (pH 7.3); abrupt smooth boundary.

Bt1--5 to 12 inches; brown (10YR 5/3) clay, very dark grayish brown (10YR 3/2) moist; moderate medium prismatic structure; hard, firm, very sticky and very plastic; common very fine and medium expd roots; few very fine interstitial pores; many moderately thick clay films on faces of peds; 5 percent pebbles; slightly alkaline (pH 7.8); clear smooth boundary.

Bt2--12 to 27 inches; yellowish brown (10YR 5/4) clay, dark yellowish brown (10YR 4/4) moist; strong medium prismatic structure; very hard, firm, very sticky and very plastic; common very fine, few fine, and medium roots; continuous pressure faces; 5 percent pebbles; slightly alkaline (pH 7.8); clear wavy boundary.

2Bqkm--27 to 60 inches; continuous indurated duripan with 1/2 to 2 millimeters continuous laminar caps throughout the horizon; 5 percent pebbles and 20 percent cobbles.

Type location: Elko County, Nevada; approximately 12 miles north of Wells in Hunter Draw; about 680 feet west and 2,400 feet south of the northeast of section 27, T. 39 N., R. 63 E.; (41 degrees, 14 minutes, 12 seconds north latitude and 114 degrees, 49 minutes, 54 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry July to October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 7 to 13 inches, may include upper of Bt horizon of some pedons.

Depth to duripan: 20 to 37 inches.

Control section:

Clay content--40 to 55 percent.

Rock fragments--0 to 10 percent pebbles.

A horizon:

Value--4 or 5 dry, 2 or 3 moist. (6 dry and 4 moist common in the lower subhorizon).

Chroma--2 or 3.

Reaction--Slightly acid or neutral.

Bt horizons:

Hue--10YR or 7.5YR.

Value--4 through 6 dry, 3 through 5 moist.

Chroma--2 through 4.

Rock fragments--Up to 15 percent in any one horizon.

Elko County, Nevada, Northeast Part--Part I

Structure--Moderate or strong medium or coarse prismatic or fine to coarse subangular or angular blocky.

Reaction--Neutral to slightly alkaline.

Bqkm horizon:

Reaction--Slightly alkaline or moderately alkaline.

Other features--Noneffervescent to strongly effervescent in the matrix but contains few to many lime coatings on the surface or in fractures.

Sumine Series

The Sumine series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from mixed rocks. The Sumine soils are on hills and mountains. Slopes are 15 to 75 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 42 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Aridic Argixerolls

Typical pedon: Sumine very gravelly loam, 15 to 30 percent slopes, is located in an area of map unit 757. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 60 percent pebbles.

A1--0 to 4 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; common very fine tubular pores; 45 percent pebbles; neutral (pH 7.2); clear wavy boundary.

A2--4 to 9 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine, few fine, and coarse roots; many very fine and common fine tubular pores; 35 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt1--9 to 13 inches; grayish brown (10YR 5/2) very gravelly loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine and few

coarse roots; many very fine and common fine tubular pores; few thin clay films lining tubular pores and on faces of peds; 40 percent pebbles; neutral (pH 7.3); clear wavy boundary.

Bt2--13 to 20 inches; light brownish gray (10YR 6/2) very gravelly clay loam, brown (10YR 4/3) moist; strong medium subangular block structure; hard, firm, sticky and plastic; common very fine and few fine roots; many very fine and common fine tubular pores; common moderately thick clay films lining pores and on faces of peds; 45 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt3--20 to 26 inches; light yellowish brown (10YR 6/4) very gravelly clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; common very fine and few fine roots; many very fine and few fine tubular pores; common moderately thick clay films lining pores and on faces of peds; 45 percent pebbles and 5 percent cobbles; neutral (pH 7.2); abrupt wavy boundary.

R--26 inches; hard, fractured black chert.

Type location: Elko County, Nevada; approximately 21 miles north of Wells; about 400 feet west of the northeast corner of section 31, T. 41 N., R. 62 E.; (41 degrees, 24 minutes, 24 seconds north latitude and 114 degrees, 59 minutes, 33 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the winter and spring, dry from early July through mid-October.

Soil temperature: 42 to 47 degrees F.

Mollic epipedon thickness: 8 to 17 inches thick.

Depth to bedrock: 20 to 40 inches.

Combined thickness of the A and Bt horizons: 20 to 40 inches.

Control section:

Clay content--25 to 35 percent, when mixed.

Reaction--Neutral or slightly alkaline.

Rock fragments--35 to 60 percent, when averaged.

A horizons:

Chroma--2 or 3.

Bt horizons:

Hue--10YR or 7.5YR.

Value--4 through 6 dry, 2 through 4 moist.
 Chroma--2 through 4.
 Structure--Weak to strong, very fine to medium angular or subangular blocky structure. The lower Bt horizons may be massive.

Tecomar Series

The Tecomar series consists of shallow, well drained soils that formed in residuum and colluvium derived from limestone and dolomite. Tecomar soils are on mountains and hills. Slopes are 8 to 50 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Loamy-skeletal, carbonatic, mesic Lithic Xerollic Calciorthids

Typical pedon: Tecomar extremely stony silt loam, 15 to 50 percent slopes, is located in an area of map unit 3013. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 25 percent pebbles and 15 percent cobbles.

A1--0 to 2 inches; light gray (10YR 7/2) extremely stony silt loam, brown (10YR 5/3) moist; weak thick platy structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine and fine roots; few very fine tubular and many very fine interstitial pores; 30 percent pebbles, 5 percent cobbles and 30 percent stones; violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

A2--2 to 7 inches; pale brown (10YR 6/3) extremely cobbly silt loam, brown (10YR 5/3) moist; weak fine subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; many very fine and fine roots; few very fine tubular and many very fine interstitial pores; thin lime coats on undersides of rock fragments; 40 percent pebbles, 25 percent cobbles and 10 percent stones; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Bk1--7 to 15 inches; pale brown (10YR 6/3) extremely cobbly silt loam, brown (10YR 5/3) moist; weak medium subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; many very fine, common fine, and few medium roots; common

very fine tubular and many very fine interstitial pores; thin lime coats on rock fragment surfaces and common thin lime pendants on undersides of rock fragments; 40 percent pebbles, 25 percent cobbles, and 10 percent stones; violently effervescent; strongly alkaline (pH 9.0) abrupt smooth boundary.

Bk2--15 to 19 inches; very pale brown (10YR 8/3) extremely cobbly silt loam, pale brown (10YR 6/3) moist; moderate medium subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; many very fine, few fine and medium roots; common very fine tubular and many very fine interstitial pores; thin lime coats on rock fragments surfaces and common thin lime pendants on undersides of rock fragments; 40 percent pebbles, 25 percent cobbles and 10 percent stones; violently effervescent; strongly alkaline (pH 9.0); abrupt smooth boundary.

R--19 inches; limestone.

Type location: Elko County, Nevada; approximately 10 miles south of Montello; about 500 feet east and 1,250 feet south of the northwest corner of section 34 T. 38 N., R. 68 E.; (41 degrees, 08 minutes, 11 seconds north latitude and 114 degrees, 16 minutes, 19 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry June through October.

Soil temperature: 47 to 52 degrees F.

Depth to bedrock: 10 to 20 inches.

Depth to calcic horizon: 4 to 14 inches.

Control section:

Clay content--20 to 27 percent.

Reaction--Moderately alkaline or strongly alkaline.

Calcium carbonate equivalent--40 to 60 percent by weight of the less than 20 millimeters fraction.

Rock fragments--50 to 80 percent, mainly pebbles, cobbles and some stones.

A horizons:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Bk horizons:

Value--6 through 8 dry, 4 through 7 moist.

Chroma--3 or 4.

Toano Series

The Toano series consists of very deep, well drained soils that formed in silty alluvium from mainly calcareous sedimentary rocks with a component of loess and volcanic ash. The Toano soils are on fan skirts, inset fans, inset fan remnants and stream terrace. Slopes are 0 to 8 percent. The mean annual precipitation is about 7 inches and the mean annual temperature is about 47 degrees. F.

Taxonomic class: Coarse-silty, mixed (calcareous), mesic Typic Torriorthents

Typical pedon: Toano silt loam, 2 to 4 percent slopes, is located in an area of map unit 2080. (Colors are for dry soil unless otherwise noted.)

A1--0 to 3 inches; light gray (10YR 7/2) silt loam, grayish brown (10YR 5/2) moist; moderate thick platy structure; hard, very friable, slightly sticky and slightly plastic; common very fine, fine and few medium roots; many very fine, fine interstitial and common very fine vesicular pores; 2 percent pebbles; strongly effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

A2--3 to 5 inches; light gray (10YR 7/2) silt loam, brown (10YR 5/3) moist; weak coarse subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; common very fine, fine, and few medium roots; many very fine interstitial, common very fine and fine tubular pores; 2 percent pebbles, violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

Bw--5 to 21 inches; light gray (10YR 7/2) silt loam, brown (10YR 5/3) moist; weak coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, and common medium roots; many very fine interstitial, common very fine and fine tubular pores; thin lime coats on undersides of rock fragments; 2 percent pebbles; violently effervescent; strongly alkaline (pH 8.6); clear wavy boundary.

C1--21 to 31 inches; light gray (2.5Y 7/2) silt loam, brown (10YR 5/3) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and few fine roots; many very fine interstitial pores; violently

effervescent; strongly alkaline (pH 9.0); clear wavy boundary.

C2--31 to 39 inches; light gray (10YR 7/2) silt loam, brown (10YR 5/3) moist; massive; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine roots; many very fine interstitial pores; 3 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

C3--39 to 60 inches; light gray (2.5Y 7/2) very fine sandy loam, grayish brown (2.5Y 5/2) moist; massive; soft, very friable, slightly sticky and slightly plastic; few very fine roots; many very fine interstitial, few very fine and fine tubular pores; 3 percent pebbles; violently effervescent; moderately alkaline (pH 8.2).

Type location: Elko County, Nevada; approximately 9 miles northeast of Montello; about 4,500 feet east and 2,000 feet north of the southwest corner of section 21, T. 40 N., R. 70 E.; (41 degrees, 20 minutes, 03 seconds north latitude and 114 degrees, 02 minutes, 41 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist for short periods in winter and spring, dry late May through November.

Soil temperature: 53 to 59 degrees F.

Control section:

Clay content--8 to 15 percent.

Rock fragments--Less than 5 percent in any subhorizon.

Reaction--Moderately alkaline or strongly alkaline.

Calcium carbonate equivalent--10 to 30 percent.

A horizons:

Hue--2.5Y or 10YR.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Effervescence--Strongly effervescent or violently effervescent.

Bw horizon:

Hue--2.5Y or 10YR.

Value--6 or 7 dry, 4 through 6 moist.

Chroma--2 or 3.

Texture--Silt loam or very fine sandy loam.

C horizons:

Hue--2.5Y or 10YR.

Value--6 through 8 dry, 4 through 6 moist.

Chroma--2 or 3.

Texture--Silt loam or very fine sandy loam.

Other features--Some pedons have stratified extremely gravelly sandy loam to extremely gravelly sand below 40 inches.

Tomsherry Series

The Tomsherry series consists of moderately deep to duripan, well drained soils that formed in alluvium derived from volcanic ash. Tomsherry soils are on plateaus. Slopes are 4 to 15 percent. The mean annual precipitation is about 12 inches, and the mean annual temperature is about 43 degrees F.

Taxonomic class: Ashy, frigid Xeric Durandepts

Typical pedon: Tomsherry fine sandy loam, 4 to 15 percent slopes, is located in an area of map unit 990. (Colors are for dry soil unless otherwise noted.)

A1--0 to 3 inches; grayish brown (10YR 5/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak thin platy structure; soft, very friable, nonsticky and slightly plastic; many very fine and common fine roots; many very fine tubular pores; neutral (pH 7.2); clear smooth boundary.

AB--3 to 10 inches; brown (10YR 5/3) fine sandy loam, dark brown (10YR 3/3) moist; weak thick platy structure; slightly hard, very friable, nonsticky and slightly plastic; common very fine, fine, and few medium and coarse roots; common very fine and fine tubular pores; slightly alkaline (pH 7.8); clear smooth boundary.

Bk--10 to 20 inches; pale brown (10YR 6/3) fine sandy loam, brown (10YR 4/3) moist; weak thick platy structure parting to moderate medium subangular blocky; hard, friable, nonsticky and slightly plastic; common very fine, fine, and few medium roots; common very fine and fine tubular pores; 20 percent hard (dry) and friable (moist) nodules; few fine lime threads and soft lime masses; common moderately thick lime coats on the undersides

of pebbles; 5 percent pebbles; moderately alkaline (pH 7.9); abrupt smooth boundary.

Bqkm1--20 to 26 inches; pale brown (10YR 6/3) fractured lime and silica indurated duripan, brown (10YR 4/3) moist; strong very thick platy structure; very rigid; common very fine and fine roots along horizontal fractures between plates; few very fine tubular pores; thin and moderately thick lime coats along plates and common moderately thick lime coats on undersides of pebbles; common fine threads and soft lime masses; 5 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); clear smooth boundary.

Bqkm2--26 to 33 inches; light gray (10YR 7/2) fractured lime and silica indurated duripan, pale brown (10YR 6/3) moist; strong very thick platy structure; very rigid; common very fine and fine roots along horizontal fractures between plates; few very fine tubular pores; moderate thick and thick lime coats along plates and common moderately thick lime coats on undersides of pebbles; 5 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

2C1--33 to 48 inches; light gray (10YR 7/2) loamy fine sand, pale brown (10YR 6/3) moist; weak medium platy structure; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; common very fine and fine tubular pores; common fine and medium threads and soft lime masses; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

2C2--48 to 60 inches; light gray (10YR 7/2) loamy fine sand, pale brown (10YR 6/3) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; common very fine tubular pores; common fine and medium threads and soft lime masses; violently effervescent; moderately alkaline (pH 8.2).

Type location: Elko County, Nevada; approximately 7 miles south of the junction of Nevada, Utah, and Idaho state boundaries; about 2,000 feet east and 2,000 feet north of the southwest corner of section 8, T. 46 N., R. 70 E.; (41 degrees, 53 minutes, 19 seconds north latitude and 114 degrees, 02 minutes, 44 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry late June through October.

Soil temperature: 43 to 47 degrees F.

Depth to duripan: 20 to 40 inches.

Mollic epipedon thickness: 7 to 11 inches.

Control section:

Clay content--5 to 15 percent.

Rock fragments--0 to 10 percent pebbles.

A horizons:

Chroma--2 or 3.

Bk horizon:

Value--6 through 8 dry, 4 through 6 moist.

Chroma--2 or 3

Structure--Weak or moderate platy, subangular blocky or it is massive.

Calcium carbonate equivalent--15 to 25 percent.

2C horizons:

Value--6 through 8 dry, 4 through 6 moist.

Chroma--2 through 4.

Texture--Fine sandy loam through loamy sand.

Coarse fragments--0 to 15 percent gravel.

Reaction--Moderately alkaline to strongly alkaline.

Trinidad Series

The Trinidad series consists of shallow, well drained soils that formed in residuum derived from sedimentary rocks. The Trinidad soils are on hills. Slopes are 2 to 50 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy, carbonatic, frigid, shallow Xeric Torriorthents

Typical pedon: Trinidad gravelly silt loam, 15 to 50 percent slopes, is located in an area of map unit 961. (Colors are for dry soil unless otherwise noted.)

A--0 to 2 inches; light gray (10YR 7/2) gravelly silt loam, brown (10YR 5/3) moist; moderate very thick platy structure parting to moderate very thin and thin platy; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine, fine, and few medium vesicular pores; many lime pendants on pebbles; 30 percent pebbles; 30 percent very fine and fine subangular blocky rock structure;

violently effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.

C1--2 to 8 inches; pale brown (10YR 6/3) gravelly silt loam, brown (10YR 5/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; few very fine and fine tubular pores; many lime pendants on pebbles; 15 percent pebbles; 30 percent very fine and fine subangular blocky rock structure; violently effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

C2--8 to 13 inches; light gray (10YR 7/2) gravelly silt loam, pale brown (10YR 6/3) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; many lime pendants on pebbles; 15 percent pebbles and 5 percent cobbles; 30 percent very fine to fine subangular blocky rock structure; violently effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

Cr--13 to 21 inches; very pale brown (10YR 7/3) soft limestone, pale brown (10YR 6/3) moist; slightly hard, firm; common very fine and fine roots along weak fractures; violently effervescent; abrupt wavy boundary.

R--21 inches; hard limestone with few very fine roots in fractures; strongly effervescent.

Type location: Elko County, Nevada; approximately 12 miles east of the Gilmer Ranch; approximately 1,000 feet south of the northeast corner of section 31, T. 44 N., R. 62 E.; (41 degrees, 40 minutes, 02 seconds north latitude and 114 degrees, 59 minutes, 26 seconds west longitude.)

Range in Characteristics:

Soil moisture: These soils are moist in winter and spring, dry June through early November.

Soil temperature: 45 to 47 degrees F.

Organic carbon: Averages 1.5 to 2.4 percent throughout the whole soil.

Depth to paralithic contact: 6 to 14 inches.

Depth to hard bedrock: 20 to 30 inches.

Control section:

Percent clay--Averages 18 to 27 percent.

Calcium carbonate equivalent--40 to 80 percent for the less than 20 millimeters fraction.

Secondary carbonates--Most pebbles have lime pendants.

Rock fragments--15 to 35 percent, mostly pebbles.

A horizons:

Value--5 through 7 dry, 4 or 5 moist.

C horizon:

Value--5 through 7 dry, 4 through 6 moist.

Chroma--2 or 3.

Structure--Weak to moderate subangular blocky or is massive.

Tulase Series

The Tulase series consists of very deep, well drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. Tulase soils are on inset fans. Slopes are 0 to 4 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Coarse-silty, mixed (calcareous), mesic, Durorthidic Xeric Torriorthents

Typical pedon: Tulase very fine sandy loam, 0 to 2 percent slopes, is located in an area of map unit 2081. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; light brownish gray (10YR 6/2) very fine sandy loam, dark brown (10YR 3/3) moist; moderate medium and thick platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots; common very fine tubular pores; strongly effervescent; moderately alkaline (pH 8.3); abrupt smooth boundary.

A2--2 to 6 inches; pale brown (10YR 6/3) very fine sandy loam, brown (10YR 4/3) moist; strong thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine tubular pores; strongly effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

C1--6 to 14 inches; pale brown (10YR 6/3) very fine sandy loam, brown (10YR 4/3) moist; moderate coarse prismatic structure parting to weak thin platy; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores;

violently effervescent; strongly alkaline (pH 8.6); clear smooth boundary.

C2--14 to 18 inches; pale brown (10YR 6/3) silt loam, brown (10YR 5/3) moist; weak thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; few fine lime filaments; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Ck--18 to 28 inches; pale brown (10YR 6/3) silt loam, brown (10YR 5/3) moist; weak thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine tubular pores; common fine lime filaments; violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

2Cqk--28 to 35 inches; light gray (10YR 7/2) very fine sandy loam, pale brown (10YR 6/3) moist; massive; soft, very friable, nonsticky and slightly plastic; few very fine and fine roots; common very fine tubular pores; 25 percent, 10 to 25 millimeter weak durinodes; common fine lime filaments; violently effervescent; strongly alkaline (pH 8.6); abrupt smooth boundary.

2C'k--35 to 38 inches; white (10YR 8/2) very fine sandy loam, volcanic ash, light gray (10YR 7/2) moist; massive; soft, very friable, slightly sticky and slightly plastic; few very fine and fine roots; common very fine tubular pores; common fine lime filaments; violently effervescent; moderately alkaline (pH 8.4); abrupt smooth boundary.

3C'qk--38 to 47 inches; pale brown (10YR 6/3) silt loam, brown (10YR 5/3) moist; common fine distinct strong brown (7.5YR 5/6) mottles, dark brown (7.5YR 4/4) moist; weak thin platy structure; hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; common very fine tubular pores; 20 percent 10 to 25 millimeters weak lime and silica cementation; many fine and medium lime filaments and seams; violently effervescent; strongly alkaline (pH 8.6); abrupt wavy boundary.

4C'k--47 to 60 inches; pale brown (10YR 6/3) very gravelly clay loam, brown (10YR 5/3) moist; many fine distinct strong brown (7.5YR 5/6) mottles, dark brown (7.5YR 4/4) moist; massive; slightly hard, friable, moderately sticky and moderately plastic; few very fine roots;

common very fine tubular pores; many fine and medium lime filaments, seams, and soft masses; common thin lime coats undersides of pebbles; 45 percent pebbles; violently effervescent; strongly alkaline (pH 8.6).

Type location: Elko County, Nevada; approximately 26 miles northeast of Wells; about 3,240 feet west and 500 feet south of the northeast corner of section 24, T. 40 N., R. 65 E.; (41 degrees, 20 minutes, 23 seconds north latitude and 114 degrees, 34 minutes, 08 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry late June through October.

Soil temperature: 47 to 52 degrees F.

Depth to Cq or Cqk horizon: 11 to 30 inches.

A horizons:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

C horizons:

Value--6 or 7 dry, 4 or 5 moist.

Structure--Platy or prismatic.

Cq, Cqk horizons:

Texture--Silt loam or very fine sandy loam.

Silica cementation--20 to 50 percent durinodes.

Up to 50 percent discontinuous silica-lime cementation is common in most Cqk horizons.

Value--6 through 8 dry, 5 through 7 moist.

Chroma--2 through 4.

Structure--Massive, subangular blocky, or platy.

Tusel Series

The Tusel series consists of deep, well drained soils that formed in residuum and colluvium derived from mixed rocks, loess, and volcanic ash. Tusel soils are on hills and mountains. Slopes are 15 to 50 percent. The mean annual precipitation is about 17 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy-skeletal, mixed Argic Pachic Cryoborolls

Typical pedon: Tusel very cobbly loam, 15 to 50 percent slopes, is located in an area of map unit 570. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 15 percent pebbles, 35 percent cobbles, and 10 percent stones.

A1--0 to 3 inches; brown (10YR 5/3) very cobbly loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine interstitial and few fine tubular pores; 10 percent pebbles, 25 percent cobbles, and 5 percent stones; neutral (pH 6.8); clear wavy boundary.

A2--3 to 11 inches; dark brown (10YR 4/3) very cobbly loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, common fine, and few medium roots; many very fine and few fine tubular pores; 10 percent pebbles, 30 percent cobbles, and 10 percent stones; neutral (pH 6.8); clear wavy boundary.

2Bt1--11 to 20 inches; brown (10YR 5/3) very gravelly clay loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; hard, friable, slightly sticky and moderately plastic; many very fine and common fine roots; many fine, common medium, and very fine tubular pores; few thin clay films on faces of peds and lining pores; 45 percent pebbles and 10 percent cobbles; neutral (pH 6.6); clear wavy boundary.

2Bt2--20 to 45 inches; light yellowish brown (10YR 6/4) extremely gravelly clay loam, dark brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky and moderately plastic; common very fine and few fine roots; common very fine and few fine tubular pores; common thin clay films on faces of peds and lining pores; 40 percent pebbles, 20 percent cobbles, and 5 percent stones; neutral (pH 6.6); abrupt irregular boundary.

3R--45 inches; quartzite.

Type location: Elko County, Nevada; approximately 22 miles north of Wells; about 500 feet east and 2,000 feet north of the southwest corner

of section 21, T. 41 N., R. 62 E.; (41 degrees, 25 minutes, 38 seconds north latitude and 114 degrees, 58 minutes, 13 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist in the late fall through early summer, dry late July through September.

Soil temperature: 43 to 47 degrees F.

Average summer soil temperature: 58 to 59 degrees F.

Mollic epipedon thickness: 16 to 22 inches, includes the upper argillic horizon of some pedons.

Depth to base of Bt horizon: 36 to 50 inches.

Depth to bedrock: 40 to over 80 inches.

Control section:

Clay content--25 to 35 percent.

Reaction--Slightly acid or neutral.

Rock fragments--50 to 75 percent, mainly pebbles.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Hue--10YR or 7.5YR.

Value--4 through 6 dry, 3 or 4 moist.

Chroma--2 through 4.

Texture--Very gravelly or extremely gravelly sandy clay loam or very gravelly or extremely gravelly clay loam, with 40 to 60 percent sand.

Clay content--25 to 35 percent, when averaged.

Rock fragments--40 to 60 percent pebbles and 10 to 25 percent cobbles and 0 to 10 percent stones.

Structure--Weak to moderate subangular blocky.

Tweener Series

The Tweener series consists of very shallow and shallow, well drained soils that formed in residuum and colluvium derived from mixed rocks. The Tweener soils are on hills and mountains. Slopes are 4 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Lithic Argixerolls

Typical pedon: Tweener very gravelly loam, 4 to 15 percent slopes, is located in an area of map unit 1191. (Colors are for dry soils unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles and 5 percent cobbles.

A1--0 to 3 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and few medium roots; many very fine tubular pores; 30 percent pebbles and 5 percent cobbles; neutral (pH 6.8); clear smooth boundary.

A2--3 to 6 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine, fine, few medium, and coarse roots; many very fine and common fine tubular pores; 30 percent pebbles and 10 percent cobbles; neutral (pH 7.2); clear smooth boundary.

Bt--6 to 10 inches; brown (10YR 5/3) very cobbly clay loam, dark brown (10YR 3/3) moist; moderately fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine and fine roots; many very fine tubular pores; common moderately thick clay films on faces of peds, lining pores and bridging mineral grains; 15 percent pebbles, 40 percent cobbles; neutral (pH 7.2); abrupt wavy boundary.

R--10 inches; fractured welded tuffs.

Type location: Elko County, Nevada; approximately 6 miles south of the Gilmer Ranch; about 200 feet west and 4,200 feet south of the northeast corner of section 7, T. 43 N., R. 61 E.; (41 degrees, 37 minutes, 40 seconds north latitude and 115 degrees, 06 minutes, 29 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry from late July through October for 70 to 100 days.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 7 to 14 inches and

Elko County, Nevada, Northeast Part--Part I

includes all of the argillic horizon.

Depth to bedrock: 7 to 14 inches.

Control section:

Clay content--18 to 35 percent.

Rock fragments--35 to 60 percent, mainly cobbles and stones.

A horizons:

Value--4 or 5 dry; 2 or 3 moist.

Bt horizon:

Value--4 or 5 dry; 2 or 3 moist.

Chroma--2 or 3.

Texture--Very cobbly clay loam or very cobbly loam.

Clay content--25 to 40 percent.

Vadaho Series

The Vadaho series consists of shallow, well drained soils that formed in loess and volcanic ash over alluvium mixed rocks. The Vadaho soils are on fan remnants. Slopes are 2 to 30 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Loamy, mixed, mesic, shallow Orthodic Durixerolls

Typical pedon: Vadaho silt loam, 2 to 8 percent slopes, is located in an area of map unit 620. (Colors are for dry soils unless otherwise noted)

A--0 to 6 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) moist; weak coarse subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; common very fine, fine, medium and coarse roots; few very fine tubular and common very fine interstitial pores; 5 percent pebbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

Bq--6 to 13 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; very hard, friable, moderately sticky and slightly plastic; few very fine, fine, and medium roots; few very fine tubular pores; 20 percent weak durinodes; 5 percent pebbles; continuous weak brittle matrix; slightly alkaline (pH 7.8); clear smooth boundary.

Bqk--13 to 18 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 3/3) moist; moderate medium and coarse subangular blocky structure; very hard, firm, moderately sticky and slightly plastic; few very fine and fine roots; few very fine tubular pores; 30 percent weak durinodes; 5 percent pebbles; continuous weak brittle matrix; violently effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

Bqkm--18 to 19 inches; indurated duripan with a continuous 1 to 2 millimeter thick silica laminae; violently effervescent; clear wavy boundary.

2Cqk--19 to 26 inches; very pale brown (10YR 7/3) silt loam, brown (10YR 5/3) moist; massive; hard, firm, moderately sticky and slightly plastic; few very fine roots; few very fine tubular pores; 5 percent weak durinodes; 10 percent pebble size duripan fragments; continuous weak brittle matrix; violently effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

2Cqkm--26 to 38 inches; indurated duripan with a continuous 2 to 7 millimeter thick silica laminae; violently effervescent; abrupt wavy boundary.

3C'qk--38 to 60 inches; pale brown (10YR 6/3) very gravelly sandy loam, brown (10YR 4/3) moist; massive; hard, firm, slightly sticky and slightly plastic; few very fine tubular pores; moderately thick lime coats on pebbles; 50 percent pebbles; continuous brittle matrix; violently effervescent; moderately alkaline (pH 8.4)

Type location: Elko County, Nevada; approximately 9 miles east of Jackpot; about 1,000 feet east and 2,000 feet south of the northwest corner of section 20, T. 47 N., R. 66 E.; (41 degrees, 57 minutes, 01 seconds north latitude and 114 degrees, 30 minutes, 32 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the winter and early spring, dry late June through October.

Soil temperature: 47 to 52 degrees F.

Depth to duripan: 14 to 20 inches.

Mollic epipedon thickness: 7 to 14 inches.

Control section:

Percent clay--Averages 20 to 27 percent.

Rock fragments--Averages 5 to 15 percent, mainly pebbles.

A horizon:

Chroma--2 or 3.

Bq horizon:

Chroma--2 or 3.

Texture--Loam or silt loam.

Durinodes--5 to 40 percent.

Bqk horizon:

Value--5 or 6 dry.

Chroma--2 through 4.

Texture--Loam or silt loam.

Durinodes--5 to 40 percent.

Effervescence--Strongly effervescent to violently effervescent.

2Cqk horizon:

Durinodes--5 to 40 percent.

Duripan fragments--5 to 25 percent, mostly pebble size.

3Cqk horizon:

Value--6 or 7 dry, 3 or 4 moist.

Rock fragments--40 to 60 percent, mainly pebbles.

Valmy Series

The Valmy series consists of very deep, well drained soils that formed in loess and volcanic ash over alluvium derived from mixed rocks. The Valmy soils are on stream terraces and fan skirts. Slopes are 0 to 8 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 50 degrees F.

Taxonomic class: Coarse-loamy, mixed (calcareous), mesic Durorthidic Torriorthents

Typical pedon: Valmy fine sandy loam, 2 to 8 percent slopes, is located in an area of map unit 340. (Colors are for dry soil unless otherwise noted.)

A--0 to 2 inches; light brownish gray (10YR 6/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; moderate, medium and thick platy structure; slightly hard, very friable, nonsticky and slightly plastic; few very fine roots;

common very fine vesicular and many very fine interstitial pores; 5 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); clear smooth boundary.

C--2 to 6 inches; pale brown (10YR 6/3) fine sandy loam, dark grayish brown (10YR 4/2) moist; weak thin and medium platy structure; slightly hard, very friable, nonsticky and slightly plastic; many very fine, fine, and few medium roots; few very fine tubular and many very fine interstitial pores; 5 percent pebbles; violently effervescent; strongly alkaline (pH 8.5); gradual smooth boundary.

Cqk1--6 to 15 inches; pale brown (10YR 6/3) fine sandy loam, grayish brown (10YR 5/2) moist; massive; slightly hard, very friable, nonsticky and slightly plastic; many very fine, fine, and few medium roots; common very fine tubular and many very fine interstitial pores; 10 percent weak durinodes; 5 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); gradual smooth boundary.

Cqk2--15 to 38 inches; pale brown (10YR 6/3) stratified sandy loam and fine sandy loam, brown (10YR 5/3) moist; massive; slightly hard, very friable, nonsticky and slightly plastic; many very fine, fine, and few medium roots; common fine tubular and many very fine interstitial pores; 35 percent weak to hard durinodes; 30 percent discontinuous weakly cemented matrix; 5 percent pebbles; violently effervescent; strongly alkaline (pH 8.5); clear smooth boundary.

Cq--38 to 60 inches; pale brown (10YR 6/3) fine sandy loam, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and slightly plastic; few fine roots; common very fine, fine tubular, and many very fine interstitial pores; 5 percent weak durinodes; 2 percent pebbles; violently effervescent; very strongly alkaline (pH 9.2).

Type location: Elko County, Nevada; approximately 10 miles south of Jackpot; about 1,500 feet east and 2,000 feet north of the southwest corner of section 3, T. 45 N., R. 64 E.; (41 degrees, 48 minutes, 55 seconds north latitude and 114 degrees, 42 minutes, 54 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, November through May.
Soil temperature: 47 to 52 degrees F.

Depth to Cq horizon: 6 to 20 inches.

Control section:

Percent clay--5 to 15.

Rock fragments--Averages 0 to 15 percent pebbles; some pedons may have up to 35 percent pebbles in thin horizon.

Effervescence--Noneffervescent to violently effervescent in the upper 10 inches, slightly effervescent to violently effervescent below 10 inches.

A horizon:

Hue--10YR or 2.5Y.

Value--5 or 6 dry, 3 or 4 moist.

Reaction--Moderately alkaline or strongly alkaline.

C horizons:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 through 4.

Texture--Mainly fine sandy loam or sandy loam, but includes strata of very fine sandy loam or coarse sandy loam in some pedons.

Consistence--Slightly hard or hard dry, very friable or friable moist.

Reaction--Strongly alkaline to very strongly alkaline.

Other features--Durinodes range from 5 to 85 percent by volume in any one horizon but one or more horizons more than 6 inches thick contain more than 35 percent durinodes that are hard to extremely hard, firm to very firm and brittle.

Vanwyper Series

The Vanwyper series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from mixed rocks. Vanwyper soils are on hills and mountains. Slopes are 15 to 50 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, mesic Xerollic Haplargids

Typical pedon: Vanwyper very stony loam, 15 to 50 percent slopes, is located in an area of map unit 020. (Colors are for dry soil unless otherwise noted.) The soil surface is partially

covered with 30 percent pebbles, 10 percent cobbles, and 10 percent stones.

A1--0 to 2 inches; light grayish brown (10YR 6/2) very stony loam, dark grayish brown (10YR 4/2) moist; weak thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine and common fine vesicular pores; 30 percent pebbles, 5 percent cobbles, and 10 percent stones; neutral (pH 6.8); abrupt wavy boundary.

A2--2 to 7 inches; light grayish brown (10YR 6/2) very cobbly loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine roots; many very fine and few fine tubular pores; 30 percent pebbles, 10 percent cobbles, and 5 percent stones; neutral (pH 6.8); clear wavy boundary.

Bt1--7 to 15 inches; brown (10YR 5/3) very cobbly clay, dark brown (10YR 4/3) moist; moderate fine and medium angular blocky structure; very hard, firm, very sticky and very plastic; common very fine roots; common very fine and few fine tubular pores; common moderately thick clay films on faces of peds and lining pores; 30 percent pebbles, 15 percent cobbles, and 5 percent stones; neutral (pH 7.0); clear wavy boundary.

Bt2--15 to 35 inches; brown (10YR 5/3) very cobbly clay, dark yellowish brown (10YR 4/4) moist; moderate fine and medium angular blocky structure; very hard, firm, very sticky and very plastic; few very fine roots; common very fine and few fine tubular pores; many moderately thick clay films on faces of peds and lining pores; 30 percent pebbles, 20 percent cobbles, and 5 percent stones; neutral (pH 6.8); abrupt wavy boundary.

R--35 inches; fractured quartzite and conglomerate with some clay material between cracks.

Type location: Elko County, Nevada; about 22 miles north of Wells, in the Tabor Creek drainage; 1,200 feet north and 2,300 feet west of the southeast corner of section 16, T. 41 N., R. 61 E.; (41 degrees, 26 minutes, 23 seconds north latitude and 115 degrees, 04 minutes, 37 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the winter and spring, dry from late June through mid October.

Soil temperature: 47 to 50 degrees F.

Depth to bedrock: 20 to 40 inches.

Control section:

Percent clay--35 to 55 percent.

Rock fragments--35 to 60 percent dominated by cobbles.

Reaction--Neutral or slightly alkaline.

A horizons:

Value--3 or 4 moist.

Chroma--2 or 3.

Bt horizons:

Hue--10YR or 7.5YR.

Value--4 through 6 dry, 3 through 5 moist.

Chroma--3 or 4.

Texture--Very cobbly clay loam and very cobbly clay.

Structure--Angular or subangular blocky in the upper part, prismatic in the lower part.

Other features--Some pedons have a thin coat of carbonates on the undersides of rock fragments.

slightly plastic; many very fine, fine, and few medium roots; many very fine tubular pores; 35 percent pebbles and 5 percent cobbles; neutral (pH 6.8); clear smooth boundary.

Bt1--5 to 12 inches; brown (10YR 5/3) very gravelly clay loam, very dark brown (10YR 2/2) moist; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine and few fine roots; common very fine and fine tubular pores; common thin clay films on mineral grains; 50 percent pebbles and 5 percent cobbles; neutral (pH 6.8); clear smooth boundary.

Bt2--12 to 21 inches; pale brown (10YR 6/3) very gravelly clay loam, very dark grayish brown (10YR 3/2) moist; massive; hard, firm, moderately sticky and moderately plastic; many very fine, fine, and few medium roots; common very fine interstitial pores; common moderately thick clay films on mineral grains; 50 percent pebbles, 5 percent cobbles; neutral (pH 6.8); abrupt wavy boundary.

R--21 inches; welded tuff rock.

Type location: Elko County, Nevada; approximately 12 miles southwest of Jackpot; about 750 feet east and 2,500 feet north of the southwest corner of section 30, T. 46 N., R. 61 E.; (41 degrees, 50 minutes, 48 seconds north latitude and 115 degrees, 07 minutes, 12 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, dry in late summer.

Soil temperature: 40 to 44 degrees F.

Thickness of mollic epipedon: 10 to 17 inches.

Depth to bedrock: 20 to 40 inches.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--1 through 3 moist or dry.

Bt horizons:

Hue--10YR or 7.5YR

Value--5 or 6 dry, 2 through 4 moist.

Chroma--2 or 3 moist or dry.

Clay content--28 to 35 percent

Rock fragments--35 to 60 percent.

Vitale Series

The Vitale series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from volcanic rocks and sandstone. Vitale soils are on hills and mountains. Slopes are 4 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual air temperature is about 41 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Typic Argixerolls

Typical pedon: Vitale very gravelly loam, 4 to 15 percent slope is located in an area of map unit 742. (Colors are for dry soils unless otherwise noted.)

A--0 to 5 inches; brown (10YR 4/3) very gravelly loam; very dark brown (10YR 2/2) moist; moderate coarse subangular blocky structure; slightly hard, very friable, slightly sticky and

Welch Series

The Welch series consists of very deep, poorly drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. Welch soils are on flood plains. Slopes are 0 to 4 percent. Mean annual precipitation is about 14 inches, and mean annual temperature is about 42 degrees F.

Taxonomic class: Fine-loamy, mixed, frigid Cumulic Haplaquolls

Typical pedon: Welch loam, drained, nonflooded, 0 to 2 percent slopes, is located in an area of map unit 034. (Colors for dry soils unless otherwise noted).

- A1--0 to 5 inches; dark gray (10YR 4/1) loam, black (10YR 2/1) moist; weak fine and medium subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; many very fine roots; common very fine and fine tubular pores; neutral (pH 7.3); clear wavy boundary.
- A2--5 to 14 inches; gray (10YR 5/1) loam, very dark gray (10YR 3/1) moist; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; many very fine, common fine, and few medium roots; common very fine and fine tubular pores; neutral (pH 7.3); clear wavy boundary.
- A3--14 to 32 inches; gray (10YR 5/1) clay loam, very dark gray (10YR 3/1) moist; few fine distinct dark yellowish brown (10YR 4/4) mottles; weak coarse subangular blocky structure; very hard, firm, moderately sticky and moderately plastic; common very fine and few medium roots; many very fine, fine, and few medium tubular pores; slightly alkaline (pH 7.6); clear wavy boundary.
- C--32 to 38 inches; light brownish gray (10YR 6/2) clay loam, dark grayish brown (10YR 4/2) moist; common fine distinct dark yellowish brown (10YR 4/4) mottles; massive; very hard, friable, moderately sticky and moderately plastic; few very fine roots; many fine, common very fine and few medium tubular pores; slightly alkaline (pH 7.6); abrupt wavy boundary.
- Ab--38 to 44 inches; gray (10YR 5/1) fine sandy loam, very dark gray (10YR 3/1) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; many very

fine tubular pores; 10 percent pebbles; slightly alkaline (pH 7.6); abrupt wavy boundary.

C2--44 to 62 inches; light brownish gray (10YR 6/2) clay loam, dark grayish brown (10YR 4/2) moist; massive; hard, friable, moderately sticky and moderately plastic; few very fine roots; many very fine, common fine and few medium tubular pores; slightly alkaline (pH 7.6).

Type location: Elko County, Nevada; approximately 22 miles north of Wells; about 700 feet west and 10 feet north of the southeast corner of section 32, T. 41 N., R. 61 E.; (41 degrees, 23 minutes, 33 seconds north latitude and 115 degrees, 05 minutes, 31 seconds west longitude.)

Range in Characteristics:

Soil moisture: Welch soils are saturated at or near the surface for a least one month during most years, mainly during the late winter and early spring months, then drops to a depth of 18 to 36 inches from early spring through September. Drained phases are recognized.

Soil temperature: 42 to 46 degrees F.

Mollic epipedon thickness: 26 to over 60 inches, organic matter decreases irregularly with increasing depth.

Mineralogy: Mixed, but the parent material has a large component of vitric pyroclastic materials.

Control section:

Clay content--27 to 35 percent, when mixed.
Other features--Buried A horizons are common.
Some pedons have gravelly strata or strata of silty clay loam, silt loam, clay loam, very fine sandy loam or sandy loam.

A horizons:

Hue--10YR through 5Y or neutral.
Value--3 through 5 dry, 2 or 3 moist.
Chroma--0 through 3 in the upper part and 0 through 2 in the lower part.
Reaction--Slightly acid through slightly alkaline.

C horizons:

Hue--10YR, 5Y through 5B or neutral.
Value--5 through 8 dry, 3 through 5 moist.
Chroma--0 through 2.
Texture--Stratified dominantly sandy clay loam or clay loam.
Other features--None to many fine to coarse redox concentrations or depletions.

Wicup Series

The Wicup series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from pyroclastic and volcanic rocks. The Wicup soils are on fan remnants and hills. Slopes are 2 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Fine, montmorillonitic, mesic
Aridic Argixerolls

Typical pedon: Wicup silty clay loam, 4 to 15 percent slopes, is located in an area of map unit 4002. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles.

A--0 to 3 inches; grayish brown (10YR 5/2) silty clay loam, very dark grayish brown (10YR 3/2) moist; weak thin platy structure; slightly hard, very friable, moderately sticky and moderately plastic; many very fine and few fine inped roots; many very fine interstitial and common fine tubular pores; 7 percent pebbles; neutral (pH 6.9); abrupt smooth boundary.

Bt1--3 to 10 inches; brown (10YR 5/3) silty clay loam, dark brown (10YR 3/3) moist; weak fine prismatic structure parting to strong fine and medium angular blocky; hard, firm, moderately sticky and moderately plastic; common very fine and few fine inped roots; many very fine interstitial pores; few thin clay films on faces of peds and lining pores; 5 percent pebbles; neutral (pH 7.2); abrupt smooth boundary.

Bt2--10 to 13 inches; brown (10YR 5/3) silty clay, dark brown (10YR 3/3) moist; strong medium prismatic structure; very hard, very firm, very sticky and very plastic; common very fine and few medium exped roots; common very fine interstitial pores; common stress surfaces on faces of peds; 3 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt3--13 to 18 inches; yellowish brown (10YR 5/4) silty clay, brown (10YR 4/3) moist; strong medium prismatic structure; very hard, very firm, very sticky and very plastic; common very fine and few medium exped roots; common very fine interstitial pores; common stress surfaces on faces of peds; 5 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

Btk--18 to 30 inches; pale brown (10YR 6/3) silty clay loam, yellowish brown (10YR 5/4) moist; moderate fine and medium prismatic structure; hard, firm, moderately sticky and moderately plastic; few very fine exped roots; common very fine interstitial pores; few thin clay films on faces of peds; common thin silica coats on faces of peds; common fine disseminated lime; 4 percent pebbles; violently effervescent; moderately alkaline (pH 8.0); clear irregular boundary.

Cr--30 to 61 inches; pale brown (10YR 6/3) soft tuff, yellowish brown (10YR 5/4) moist; common large faint iron mottles; violently effervescent.

Type location: Elko County, Nevada; approximately 18 miles northeast of Wells in an unsurveyed area; T. 38 N., R. 65 E.; (41 degrees, 12 minutes, 17 seconds north latitude and 114 degrees, 39 minutes, 50 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from late June through October.

Soil temperature: 47 to 52 degrees F.

Mollic epipedon thickness: 8 to 15 inches, includes the upper part of Bt subhorizon.

Depth to paralithic contact: 26 to 40 inches.

Depth to carbonates: 18 to 22 inches.

Control section:

Clay content--35 to 50 percent.

Rock fragments--5 to 20 percent mainly pebbles, with up to 5 percent cobbles.

Reaction--Neutral to moderately alkaline, usually increasing with depth.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Upper Bt horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Texture--Clay loam, silty clay loam, silty clay, clay or gravelly clay loam.

Clay content--35 to 50 percent.

Rock fragments--5 to 25 pebbles

Structure--Weak or moderate, fine or medium, prismatic or angular blocky parting to angular or subangular blocky.

Reaction--Neutral or slightly alkaline.

Lower Bt horizons:

Hue--10YR or 7.5YR.

Value--5 through 7 dry, 4 or 5 moist.

Chroma--3 through 5.

Texture--Clay loam, silty clay loam, silty clay, clay or gravelly clay loam.

Clay content--35 to 50.

Rock fragments--5 to 25 percent pebbles.

Reaction--Slightly alkaline or moderately alkaline.

Other features--Most pedons have few to common thin silica coats on faces of pedis in the subhorizon overlying the paralithic contact.

Wieland Series

The Wieland series consists of very deep, well drained soils that formed in alluvium derived from mixed rocks, loess and volcanic ash. Wieland soils are on fan remnants. Slopes are 0 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Fine, montmorillonitic, mesic Durixerollic Haplargids

Typical pedon: Wieland loam, 4 to 15 percent slopes, is located in an area of map unit 094. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 10 percent pebbles.

A--0 to 3 inches; pale brown (10YR 6/3) loam, dark brown (10YR 3/3) moist; moderate thin platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine roots; many very fine interstitial pores; 5 percent pebbles; slightly alkaline (pH 7.6); clear smooth boundary.

Bt1--3 to 8 inches; pale brown (10YR 6/3) clay loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine, few fine and medium roots; many very fine interstitial and few very fine tubular pores; few thin clay films on faces of pedis and lining pores; 5 percent pebbles; slightly alkaline (pH 7.6); clear smooth boundary.

Bt2--8 to 12 inches; light yellowish brown (10YR 6/4) gravelly clay, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; hard, firm, very sticky and very plastic; common very fine roots; common very fine interstitial pores; many moderately thick clay films on faces of pedis and lining pores; 15 percent pebbles; moderately alkaline (pH 7.9); clear smooth boundary.

Bt3--12 to 22 inches; light yellowish brown (10YR 6/4) gravelly clay, dark yellowish brown (10YR 4/4) moist; weak medium prismatic parting to strong medium subangular blocky structure; hard, firm, very sticky and very plastic; common very fine roots; few very fine interstitial pores; many stress surfaces; 20 percent pebbles; moderately alkaline (pH 7.9); clear smooth boundary.

Bqk1--22 to 28 inches; light yellowish brown (10YR 6/4) gravelly clay loam, yellowish brown (10YR 5/4) moist; moderate fine and medium subangular blocky structure; slightly hard, firm, slightly sticky and slightly plastic; few fine roots; few very fine interstitial pores; 25 percent, hard, firm, 10 to 20 millimeter durinodes; lime segregated into common fine filaments, undersides of pebbles have 1 to 2 millimeters thick silica and lime coatings; 20 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Bqk2--28 to 44 inches; very pale brown (10YR 7/3) gravelly loam, light yellowish brown (10YR 6/4) moist; massive; hard, firm, and brittle, nonsticky and nonplastic; discontinuous thin silica laminar caps within horizon; 25 percent pebbles; continuous brittle matrix; violently effervescent; moderately alkaline (pH 8.4); gradual smooth boundary.

2Bqk--44 to 58 inches; light gray (2.5Y 7/2) stratified loam and sandy loam, yellowish brown (10YR 5/4) moist; massive; slightly hard, very friable, nonsticky and nonplastic; many very fine interstitial pores; many thin and medium horizontal lime seams; 15 percent hard and firm 10 millimeter durinodes; 5 percent pebbles; slightly effervescent; strongly alkaline (pH 8.6); clear smooth boundary.

2C--58 to 64 inches; light gray (5Y 7/2) sandy loam, olive (5Y 5/3) moist; massive; slightly hard, friable, nonsticky and nonplastic; many very fine and fine interstitial pores; 5 percent pebbles; slightly effervescent; slightly alkaline (pH 8.2).

Type location: Elko County, Nevada; approximately 10 miles northwest of Wells; about 2,200 feet east and 1,000 feet north of the southwest corner of section 26, T. 39 N., R. 61 E.; (41 degrees, 14 minutes, 12 seconds north latitude and 115 degrees, 03 minutes, 07 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist from late October through early June.

Soil temperature: 47 to 52 degrees F.

Depth to continuous brittle matrix: 19 to 30 inches.

Depth to base of Bt horizon: 19 to 30 inches.

Control section:

Clay content--40 to 55 percent when mixed.

Rock fragments--5 to 35 percent pebbles when mixed.

Other features--Gravelly substratum phases are recognized that have variegated colored 2C horizons with textures of very gravelly loam sand at a depth of 40 or more inches.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Reaction--Slightly alkaline or moderately alkaline.

Bt1 horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Structure--Weak or moderate very fine to medium subangular blocky or prismatic.

Consistence--Very friable or friable moist, slightly sticky to very sticky and slightly plastic to very plastic wet.

Reaction--Slightly alkaline or moderately alkaline.

Other Bt horizons:

Value--5 through 7 dry, 3 through 5 moist.

Chroma--2 through 4 dry, 3 or 4 moist.

Clay content--40 to 55 percent, when mixed, some pedons have subhorizons with up to 60 percent clay.

Rock fragments--5 to 35 percent pebbles, when mixed.

Structure--Weak or moderate, fine to coarse prismatic or very fine to medium angular blocky or subangular blocky.

Other features--Some pedons are slightly effervescent to strongly effervescent and commonly have lime filaments in the lower Bt horizons.

Bqk horizons:

Hue--10YR or 2.5Y.

Value--6 through 8 dry, 4 through 6 moist.

Chroma--1 through 4.

Effervescence--Slightly effervescent through violently effervescent.

Cementation--Some pedons have thin discontinuous weakly cemented Bqk subhorizons above the continuous brittle horizon.

Relict mottles--Present in many pedons at any depth below 30 inches.

Wiffo Series

The Wiffo series consists of very deep, somewhat excessively drained soils that formed in alluvium derived from sedimentary rocks. The Wiffo soils are on fan skirts. Slopes are 2 to 8 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy-skeletal, mixed (calcareous), mesic Xeric Torriorthents

Typical pedon: Wiffo very gravelly loam, 2 to 8 percent slopes, is located in an area of map unit 1041. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 35 percent pebbles, 1 percent cobbles, and 1 percent stones.

A1--0 to 3 inches; light brownish gray (10YR 6/2) very gravelly loam, dark grayish brown (10YR 4/2) moist; weak thick platy structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; many very fine and fine vesicular pores; 45 percent pebbles; violently effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

A2--3 to 8 inches; light brownish gray (10YR 6/2) very gravelly loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and

common coarse roots; many very fine interstitial pores; thin lime coats undersides of rock fragments; 40 percent pebbles and 5 percent cobbles; violently effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

2C1--8 to 27 inches; light gray (10YR 7/2) extremely gravelly sandy loam, brown (10YR 5/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, few medium, and coarse roots; many very fine interstitial pores; thin lime coats on undersides of rock fragments; 65 percent pebbles, 5 percent cobbles and 5 percent stones; violently effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

3C2--27 to 60 inches; light gray (10YR 7/2) stratified extremely gravelly sandy loam and very gravelly coarse sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; few very fine roots in extremely gravelly coarse sand layers and common very fine roots in extremely gravelly sandy loam layers; many very fine interstitial pores; thin lime coats on undersides of rock fragments; 75 percent pebbles; violently effervescent; strongly alkaline (pH 8.8).

Type location: Elko County, Nevada; approximately 8 miles east of Montello; about 500 feet east and 700 feet north of the southwest corner of section 4, T. 39 N., R. 70 E.; (41 degrees, 17 minutes, 13 seconds north latitude and 114 degrees, 08 minutes, 29 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry June through October.

Soil temperature: 47 to 52 degrees F.

Depth to 2C horizon: 5 to 10 inches.

Depth to 3C horizon: 20 to 35 inches.

Reaction: Moderately alkaline or strongly alkaline.

Control section:

Clay content--Averages 5 to 15 percent.

Rock fragments--Averages 50 to 75 percent, mainly pebbles.

Effervescence--Strongly effervescent or violently effervescent throughout.

Calcium carbonates equivalent--Averages 15 to

25 percent.

A horizons:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

2C horizon:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 through 4.

Texture--Very gravelly sandy loam, extremely gravelly sandy loam.

Clay content--8 to 15 percent.

Rock fragments--50 to 75 percent, mainly pebbles.

Structure--Weak subangular blocky or it is massive.

3C horizon:

Hue--10YR or 2.5Y.

Value--7 or 8 dry, 4 through 6 moist.

Chroma--2 through 4.

Texture--Stratified extremely gravelly sandy loam to very gravelly coarse sand.

Clay content--5 to 15 percent.

Rock fragments--50 to 75 percent, mainly pebbles.

Structure--The horizon is massive, or single grain.

Wiffo Variant

The Wiffo variant consists of very deep, well drained soils formed in alluvium derived from mixed rocks. Wiffo variant soils are on alluvial fans. Slopes are 2 to 8 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Loamy-skeletal, mixed, mesic Xerollic Camborthids

Typical pedon: Wiffo variant extremely stony sandy loam, is located in an area of map unit 2010. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 10 percent pebbles, 5 percent cobbles, and 5 percent stones.

A1--0 to 2 inches; light brownish gray (10YR 6/2) extremely stony sandy loam, dark grayish brown (10YR 4/2) moist; moderate thin platy

structure; soft, very friable, nonsticky and slightly plastic; many very fine and common fine roots; many very fine and fine vesicular pores; 10 percent pebbles, 20 percent cobbles and 30 percent stones; neutral (pH 7.2); clear smooth boundary.

A2--2 to 5 inches; pale brown (10YR 6/3) extremely stony sandy loam, dark brown (10YR 4/3) moist; strong thin platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine and few fine interstitial pores; 15 percent pebbles, 20 percent cobbles and 30 percent stones; slightly alkaline (pH 7.8); clear wavy boundary.

Bw--5 to 17 inches; pale brown (10YR 6/3) extremely stony sandy loam, dark brown (10YR 4/3) moist; massive; soft, very friable, slightly sticky and slightly plastic; many very fine, few fine and medium roots; many very fine interstitial and few fine tubular pores; 10 percent pebbles, 30 percent cobbles and 30 percent stones; slightly alkaline (pH 7.6); gradual wavy boundary.

Bk1--17 to 36 inches; very pale brown (10YR 7/3) extremely stony sandy loam, dark brown (10YR 4/3) moist; massive; slightly hard, friable, nonsticky and slightly plastic; many very fine, few fine, and medium roots; few fine tubular pores; few thin lime coats on undersides of rock fragments; 10 percent pebbles, 30 percent cobbles, and 30 percent stones; strongly effervescent; moderately alkaline (pH 8.4); gradual wavy boundary.

Bk2--36 to 60 inches; very pale brown (10YR 7/3) extremely stony sandy loam, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky and slightly plastic; common very fine, fine, and few medium roots; many very fine interstitial pores; few thin lime coats on undersides of rock fragments; 5 percent pebbles, 30 percent cobbles and 35 percent stones; violently effervescent; strongly alkaline (pH 8.6).

Type location: Elko County, Nevada; approximately 9 miles southeast of Montello; about 1,750 feet east and 100 feet south of the northwest corner of section 29, T. 38 N., R. 70 E.; (41 degrees, 09 minutes, 12 seconds north latitude and 114 degrees, 04 minutes, 31 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in the winter and spring, dry mid-June through October, for about 90 to 115 days following the summer solstice.

Soil temperature: 47 to 50 degrees F.

Depth to carbonates: 10 to 20 inches.

Control section:

Clay content--Averages 10 to 18 percent.

Reaction--Neutral through strongly alkaline increasing with depth.

Rock fragments--60 to 80 percent.

A horizon:

Value--5 or 6 dry, 4 or 5 moist.

Chroma--2 or 3.

Bw and Bk horizons:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--3 or 4.

Rock fragments--60 to 80 percent, mainly cobbles and stones.

Xerxes Series

The Xerxes series consists of very shallow and shallow, well drained soils that formed in residuum and colluvium derived from volcanic rocks. Xerxes soils are on plateaus and hills. Slopes are 4 to 50 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy-skeletal, mixed, mesic, shallow Mollic Haploxeralfs

Typical pedon: Xerxes extremely cobbly loamy sand, 15 to 30 percent slopes, is located in an area of map unit 1203. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 45 percent pebbles and 20 percent cobbles.

A--0 to 2 inches; light brownish gray (2.5Y 6/2) extremely cobbly loamy sand, very dark grayish brown (2.5Y 3/2) moist; weak thick platy structure; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; many very fine, few fine interstitial and few fine tubular pores; 40 percent pebbles and 35 percent cobbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

Bt1--2 to 5 inches; light brownish gray (2.5Y 6/2) cobbly fine sandy loam, very dark grayish brown (2.5Y 3/2) moist; weak thick platy structure parting to moderate medium platy; slightly hard, very friable, slightly sticky and nonplastic; common very fine, fine, few medium and coarse roots; many very fine and fine interstitial pores; common thin clay bridges between mineral grains; 10 percent pebbles and 10 percent cobbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

Bt2--5 to 10 inches; light gray (10YR 7/2) very cobbly fine sandy loam, brown (10YR 5/3) moist; moderate fine and medium subangular blocky structure parting to moderate thin platy; slightly hard, very friable, slightly sticky and nonplastic; common very fine, fine, medium and coarse roots; many very fine interstitial, common very fine and fine tubular pores; 5 percent durinodes and 5 percent medium platelike silica concretions; common thin lime coats and few thin lime pendants on undersides of rock fragments; few thin clay films on faces of peds and common thin clay films lining pores; 15 percent pebbles, 25 percent cobbles and 5 percent stones; strongly effervescent; slightly alkaline (pH 7.6); clear smooth boundary.

Cr--10 to 15 inches; strongly effervescent soft tuff.

Type location: Elko County, Nevada; approximately 24 miles southeast of Jackpot; about 1,250 feet south and 80 feet east of the northwest corner of section 26, T. 45 N., R. 67 E.; (41 degrees, 45 minutes, 52 seconds north latitude and 114 degrees, 21 minutes, 16 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, moist in winter and spring, dry from July through September.

Soil temperature: 47 to 52 degrees F.

Depth to paralithic contact: 8 to 14 inches.

Control section:

Clay content--8 to 15 percent.

Reaction--Slightly alkaline or moderately alkaline.

Rock fragments--Averages 35 to 50 percent, mainly pebbles and cobbles.

A horizon:

Hue--2.5Y or 10YR.

Value--5 or 6 dry.

Chroma--2 or 3.

Upper Bt horizon:

Hue--2.5Y or 10YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Texture--Cobbly fine sandy loam, very cobbly fine sandy loam.

Clay content--8 to 18 percent.

Rock fragments--15 to 40 percent, mainly pebbles and cobbles.

Structure--Weak or moderate, platy or subangular blocky.

Lower Bt horizons:

Hue--2.5Y or 10YR.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Texture--Very cobbly fine sandy loam, very cobbly sandy loam.

Clay content--8 to 18 percent.

Rock fragments--35 to 50 percent, mainly pebbles and cobbles.

Structure--Weak or moderate, platy or subangular blocky.

Reaction--Slightly alkaline or moderately alkaline.

Xica Series

The Xica series consists of shallow, well drained soils that formed in residuum derived from granitic rocks. The Xica soils are on hills and mountains. Slopes are 4 to 75 percent. The mean annual precipitation is about 16 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy, mixed, frigid, shallow Typic Argixerolls

Typical pedon: Xica sandy loam, 4 to 15 percent, is located in an area of map unit 701. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pebbles and 5 percent with cobbles.

A--0 to 3 inches; grayish brown (10YR 5/2) sandy loam, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine roots; many very

fine interstitial pores; 10 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

Bt1--3 to 10 inches; grayish brown (10YR 5/2) gravelly sandy loam, dark brown (7.5YR 3/2) moist; weak coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; few thin clay films as colloid stains and bridging mineral grains; 20 percent pebbles; slightly alkaline (pH 7.6); gradual smooth boundary.

Bt2--10 to 17 inches; brown (10YR 5/3) gravelly sandy clay loam, dark brown (10YR 3/3) moist; weak coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; common very fine tubular pores; common thin clay films lining pores, bridging mineral grains, and as colloid stains; 30 percent pebbles; slightly alkaline (pH 7.6); clear smooth boundary.

Cr--17 inches; soft highly weathered granite.

Type location: Elko County, Nevada; approximately 3 miles south of Middlestack Mountain; about 2,000 feet south and 2,100 feet east of the northwest corner of section 20 T. 45 N., R. 65 E.; (41 degrees, 46 minutes, 30 seconds north latitude and 114 degrees, 38 minutes, 12 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, dry late July to October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 14 to 20 inches, includes all or part of the argillic horizon.

Depth to paralithic contact: 14 to 20 inches.

Reaction--Neutral or slightly alkaline.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Hue--10YR or 7.5YR.

Value--4 through 6 dry, 3 or 4 moist.

Chroma--2 through 4.

Clay content--Averages 10 to 24 percent.

Textures--Gravelly sandy loam in upper part and gravelly sandy loam or gravelly sandy clay loam in lower part.

Structure--Weak to moderate subangular blocky.

Rock fragments--15 to 35 percent, mainly pebbles 2 to 5 millimeters in size.

Xipe Series

The Xipe series consists of very deep, very poorly drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. The Xipe soils are on flood plains. Slopes are 0 to 2 percent. The mean annual precipitation is about 8 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Fine-silty over sandy or sandy-skeletal, mixed, mesic Fluvaquentic Haplaquolls

Typical pedon: Xipe silt loam, 0 to 2 percent slopes, is located in an area of map unit 340. (Colors are for dry soil unless otherwise noted.)

A1--0 to 3 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; moderate medium and coarse subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; many very fine, fine, common medium, and few coarse roots; many very fine tubular pores; neutral (pH 6.8); abrupt smooth boundary.

A2--3 to 6 inches; dark gray (10YR 4/1) silty clay loam, black (10YR 2/1) moist; few fine distinct dark yellowish brown (10YR 4/4) mottles; strong medium and coarse prismatic structure; hard, friable, very sticky and moderately plastic; many very fine, common fine, and medium roots; many very fine and common fine tubular pores; neutral (pH 7.0); abrupt smooth boundary.

A3--6 to 10 inches; grayish brown (10YR 5/2) silty clay loam, very dark grayish brown (10YR 3/2) moist; few fine distinct dark yellowish brown (10YR 4/4) mottles; strong coarse prismatic structure; hard, friable, very sticky and moderately plastic; common very fine, fine, and medium roots; many very fine and common fine tubular pores; few fine manganese concretions; neutral (pH 7.2); abrupt irregular boundary.

Ab1--10 to 12 inches; very dark gray (10YR 3/1) silty clay loam, black (10YR 2/1) moist; few fine distinct strong brown (7.5YR 4/6) mottles; strong fine and medium subangular blocky

structure; hard, friable, very sticky and moderately plastic; common very fine, fine and medium roots; many very fine and common fine tubular pores; few fine gypsum masses; 5 percent pebbles; slightly alkaline (pH 7.4); abrupt wavy boundary.

Ab2--12 to 20 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; common, medium, faint, brown (10YR 5/3) mottles; strong thick and very thick platy structure; hard, friable, moderately sticky and slightly plastic; common very fine, fine and medium roots; many very fine and common fine tubular pores; few fine gypsum masses; slightly alkaline (pH 7.4); abrupt smooth boundary.

ACb--20 to 26 inches; gray (10YR 6/1) silty clay loam; very dark gray (10YR 3/1) moist; common medium distinct dark yellowish brown (10YR 4/4) mottles; strong medium and coarse subangular blocky structure; hard, friable, moderately sticky and moderately plastic; common very fine, fine, and medium roots; many very fine, common fine, and medium tubular pores; 5 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

2C1--26 to 37 inches; gray (10YR 6/1) gravelly loamy sand, dark grayish brown (10YR 4/2) moist; many medium and coarse distinct dark yellowish brown (10YR 4/6) and few fine distinct dark reddish brown (2.5YR 2.5/4) mottles; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine, fine and medium roots; many very fine interstitial pores; 15 percent pebbles; slightly alkaline (pH 7.4); abrupt smooth boundary.

3C2--37 to 60 inches; light brownish gray (10YR 6/2) gravelly coarse sand, dark grayish brown (10YR 4/2) moist; many coarse distinct strong brown (7.5YR 4/6) and brownish yellow (10YR 6/6) mottles; single grain; loose, nonsticky and nonplastic; few very fine, fine and medium roots; many fine interstitial pores; many fine manganese concretions; 15 percent pebbles; slightly alkaline (pH 7.4).

Type location: Elko County, Nevada; approximately 8 miles south of Jackpot, in the Salmon Falls Creek drainage; about 2,000 feet south and 1,500 feet west of the northeast corner of section 4, T. 45 N., R. 64 E.; (41 degrees, 47 minutes, 05 seconds north latitude and 114 degrees, 43 minutes, 40 seconds west longitude.)

Range in Characteristics:

Soil moisture: Saturated at some depth between the soil surface and 18 inches for at least one month during most years, mainly during late winter and spring. Average summer and fall months the depth to water table is 36 to 60 inches.

Soil temperature: 47 to 52 degrees F.

Mollic epipedon thickness: 10 to 24 inches.

Depth to contrasting textures: 15 to 35 inches.

Control section:

Percent clay--Upper part is 18 to 35 percent and the lower part is up to 5 percent.

Rock fragments--Upper part is up to 5 percent and the lower part averages 15 to 35 percent with any one strata having up to 75 percent, mainly pebbles.

A horizons:

Value--3 through 6 dry, 2 or 3 moist.

Chroma--1 or 2.

Structure--Prismatic, subangular blocky or platy.

Reaction--Neutral or slightly alkaline.

Redox concentration--Common in the lower subhorizons range from few to many, fine to coarse and are faint or distinct.

Gypsum--Absent in the lower subhorizons of many pedons.

Other features--Buried A horizons are common in most pedons.

C horizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--1 or 2.

Redox concentrations--Few to many, fine to very coarse, and faint or distinct.

Yuko Series

The Yuko series consist of very shallow and shallow, well drained soils that formed in residuum and colluvium derived from mixed rocks. Yuko soils are on hills and pediments. Slopes are 2 to 50 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy, mixed, mesic, shallow Xerollic Haplargids

Typical pedon: Yuko gravelly sandy loam, 15 to 50 percent slopes, is located in an area of map unit 010. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; light brownish gray (10YR 6/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine roots; many very fine, fine, and common medium vesicular pores; 25 percent pebbles, 5 percent cobbles; neutral (pH 7.2); abrupt smooth boundary.

A2--2 to 4 inches; brown (10YR 5/3) gravelly loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine roots; many very fine tubular pores; few thin clay films on faces of peds; 20 percent pebbles and 5 percent cobbles; neutral (pH 7.0); clear wavy boundary.

Bt1--4 to 8 inches; brown (10YR 5/3) clay loam, dark grayish brown (10YR 4/2) moist; strong medium angular blocky structure; hard, firm, moderately sticky and moderately plastic; common fine and few fine roots; few fine and many very fine tubular pores; many moderately thick clay films lining tubular pores and on faces of peds; 5 percent pebbles; neutral (pH 6.9); abrupt wavy boundary.

Bt2--8 to 10 inches; brown (10YR 5/3) clay loam, dark brown (10YR 4/3) moist; strong medium angular blocky structure; hard, very firm, very sticky and very plastic; few very fine roots; few very fine interstitial pores; continuous moderately thick clay films on faces of peds; slightly alkaline (pH 7.4); abrupt wavy boundary.

Cr--10 to 17 inches; soft tuff bedrock.

Type location: Elko County, Nevada; approximately 20 miles northwest of Wells near Tabor Creek; about 800 feet east and 2,200 feet north of the southwest corner of section 32, T. 41 N., R. 61 E.; (41 degrees, 23 minutes, 55 seconds north latitude and 115 degrees, 06 minutes, 22 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist in winter and spring; dry from June through October.

Soil temperature: 47 to 52 degrees F.

Depth to paralithic contact: 6 to 14 inches.

Control section:

Clay content--Averages 27 to 35 percent, with less than 45 percent sand.

Rock fragments--Average 5 to 15 percent, mainly pebbles and cobbles.

A horizons:

Value--5 to 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Reaction--Slightly acid or neutral.

Bt horizons:

Hue--7.5YR or 10YR.

Value--4 through 6 dry, 3 or 4 moist.

Chroma--3 through 6 dry, 2 through 6 moist.

Texture--Dominantly silty clay loam or clay loam, with subhorizons of clay in some pedons.

Clay content--30 to 40 percent.

Rock fragments--Averages 0 to 15 percent.

Reaction--Slightly acid through moderately alkaline

Other features--Some pedons have a 1 to 4 inch thick clay subhorizon.

Zapa Series

The Zapa series consists of moderately deep to duripan, well drained soils that formed in alluvium derived from mixed rocks, loess, and volcanic ash. The Zapa soils are on fan remnants. Slopes are 2 to 50 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy-skeletal, mixed, mesic Haploxerollic Durorthids

Typical pedon: Zapa very gravelly silt loam, 4 to 15 percent slopes, is located in an area of map unit 401. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; light brownish gray (10YR 6/2) very gravelly silt loam, very dark grayish brown (10YR 3/2) moist; moderate very thin and thin platy structure; soft, very friable, slightly sticky and slightly plastic; common very fine, few fine and medium roots; many very fine vesicular pores; 55 percent pebbles; slightly alkaline (pH 7.6); clear smooth boundary.

A2--2 to 5 inches; brown (10YR 5/3) very gravelly silt loam, dark brown (10YR 3/3) moist; moderate very thin and thin platy structure; soft, very friable, slightly sticky and slightly plastic; common very fine, few fine and medium roots; common very fine tubular pores; 40 percent pebbles; slightly alkaline (pH 7.8); clear smooth boundary.

Bw--5 to 7 inches; brown (10YR 5/3) very gravelly silt loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, few fine and medium roots; common very fine tubular pores; common very thin silica and silt coats lining pores; 40 percent pebbles; slightly alkaline (pH 7.8); clear wavy boundary.

Bkq1--7 to 12 inches; pale brown (10YR 6/3) very gravelly silt loam, yellowish brown (10YR 5/4) moist; massive; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine interstitial pores; many very fine to very coarse silica chips; many moderately thick to thick silica and lime pendants on the underside of rock fragments; 25 percent weak discontinuous silica cementation; 45 percent pebbles; strongly effervescent; moderately alkaline (pH 8.0); clear wavy boundary.

2Bkq2--12 to 25 inches; very pale brown (10YR 8/3) very gravelly coarse sandy loam, pale brown (10YR 6/3) moist; massive; hard, firm and brittle, nonsticky and nonplastic; common very fine and fine roots; common very fine interstitial pores; 10 percent discontinuous strong silica cementation; many very fine to very coarse silica chips; common very thin silica and silt coats lining pores; many moderately thick to thick silica and lime pendants on undersides of rock fragments; 55 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

3Bkqm1--25 to 42 inches; strongly silica cemented duripan with thin, discontinuous silica and lime laminae throughout various parts of horizon; strong medium and thick platy structure; extremely hard and slightly rigid; common very fine and fine roots in fractures between plates; 20 percent violently effervescent in a noneffervescent matrix; clear wavy boundary.

3Bkqm2--42 to 60 inches; very pale brown (10YR 8/3) extremely gravelly coarse sandy loam, pale brown (10YR 6/3) moist; massive; very hard, very firm and brittle, nonsticky and nonplastic;

many thin to moderately thick silica and lime pendants on undersides of rock fragments; 25 percent discontinuous strongly silica cemented; 75 percent pebbles; violently effervescent on undersides of rock fragments; noneffervescent matrix; strongly alkaline (pH 8.6)

Type location: Elko County, Nevada, approximately 12 miles southwest of Jackpot; about 2,640 feet south and 100 feet west of the northeast corner of section 1 T. 45 N., R. 63 E.; (41 degrees, 49 minutes, 00 seconds north latitude and 114 degrees, 46 minutes, 50 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the winter and spring, dry June through early November.

Soil temperature: 47 to 52 degrees F.

Depth to the strongly cemented duripan: 20 to 30 inches.

Depth to continuous brittle matrix: 5 to 14 inches.

Control section:

Clay content--10 to 20 percent.

Rock fragments--35 to 60 percent, mainly pebbles.

Texture--Very gravelly silt loam, very gravelly sandy loam, very gravelly coarse sandy loam.

A horizons:

Value--5 or 6 dry, 3 or 4 moist, averages greater than 5.5 dry and 3.5 moist in the upper 7 inches.

Chroma--2 or 3.

Reaction--Slightly alkaline or moderately alkaline.

Bkq horizons:

Value--6 through 8 dry, 4 through 6 moist.

Chroma--3 or 4.

Structure--Weak coarse subangular blocky or it is massive.

Reaction--Moderately alkaline or strongly alkaline.

Other features--10 to 50 percent discontinuous weak silica and lime cementation.

Bkqm horizons:

Value--7 or 8 dry, 5 through 7 moist.

Chroma--3 or 4 moist.

Structure--Strong medium to very thick platy or it is massive.

Other features--Continuous strong cementation with the average lateral distance between fracture point of more than 4 inches.

3Bqk horizon:

Texture--Extremely gravelly sandy loam or extremely gravelly coarse sandy loam
 Rock fragments--60 to 80 percent, mainly pebbles with up to 20 percent cobbles.
 Reaction--Moderately alkaline or strongly alkaline.

Zark Series

The Zark series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from tuffaceous rocks. The Zark soils are on hills. Slopes are 2 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Ashy, mesic Mollic Vitrandepts

Typical pedon: Zark loamy fine sand, 2 to 8 percent slopes, is located in an area of map unit 1201. (Colors are for dry soil unless otherwise noted.)

A1--0 to 5 inches; grayish brown (10YR 5/2) loamy fine sand, very dark grayish brown (10YR 3/2) moist; weak thick platy structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common very fine tubular pores; neutral (pH 6.8); abrupt smooth boundary.

A2--5 to 16 inches; grayish brown (10YR 5/2) loamy fine sand, very dark grayish brown (10YR 3/2) moist; massive; slightly hard, very friable, nonsticky and nonplastic; common very fine and fine roots; common very fine tubular pores; neutral (pH 7.2); clear wavy boundary.

Bq--16 to 29 inches; pale brown (10YR 6/3) loamy fine sand, brown (10YR 4/3) moist; massive; slightly hard, friable, nonsticky and nonplastic; few very fine and fine roots; common very fine tubular pores; 40 percent discontinuous weak silica cementation; 5 percent hard, firm durinodes 1/2 to 2 inches in diameter; 5 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

Bqk--29 to 35 inches; light brownish gray (2.5Y 6/2) gravelly loamy fine sand, olive brown (2.5YR 4/4) moist; massive; hard, firm and brittle, nonsticky and nonplastic; few very fine roots; few very fine tubular pores; few fine strongly effervescent irregularly shaped filaments and soft masses of lime; 20 percent pebbles; continuous brittle matrix; noneffervescent matrix; slightly alkaline (pH 7.8); abrupt wavy boundary.

2Cr--35 inches; gray (10YR 6/1) soft ashy tuff.

Type location: Elko County, Nevada; approximately 25 miles east of Jackpot; about 2,000 feet east and 2,000 feet south of the northwest corner of section 32, T. 47 N., R. 69 E.; (41 degrees, 55 minutes, 22 seconds north latitude and 114 degrees, 09 minutes, 35 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, dry from mid July through October.

Soil temperature: 47 to 52 degrees F.

Mollic epipedon thickness: 10 to 18 inches.

Depth to paralithic: 20 to 40 inches.

Volcanic ash and glass aggregates: Greater than 80 percent.

Control section:

Percent clay--5 to 15 percent.

Rock fragments--0 to 15 percent pebbles.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bq and Bqk horizons:

Hue--10YR or 2.5Y.

Chroma--2 through 4.

Texture--Loamy fine sand, loamy sand or gravelly loamy fine sand.

Rock fragments--5 to 25 percent mainly pebbles.

Reaction--Neutral to moderately alkaline, increasing with depth.

Other features--From 30 percent weak, discontinuous silica cementation in the upper subhorizons to weak, continuous silica cementation that is brittle when moist in the lower subhorizon.

Formation of the Soils

This section relates the soils in the survey area to the major factors of soil formation.

Soil is a natural body on the earth's surface in which plants grow. It is a mixture of varying proportions of rocks, minerals, organic matter, water and air. The rocks and minerals are fragmented and are partly or wholly weathered. Soils have distinctive layers, or horizons, that are the product of environmental forces acting upon material deposited or accumulated through geologic activity.

Soils differ from one another in different localities and within short distances. The differences are the result of the interaction of five soil-forming factors that are known to affect soil formation. These factors are (1) climate, mainly the temperature and kind and amount of precipitation that have existed since accumulation of the parent material; (2) living organisms, mainly the plant cover and the organisms living in and on the soil; (3) topography or relief, mainly as it affects the internal and external soil properties such as drainage, aeration, susceptibility to erosion, and exposure to sun and wind (4) parent material, including texture and structure of the material as well as its mineralogic and chemical composition; and (5) the length of time that the soil-forming factors have been operating.

In general, the landscape of the area is comprised mainly of mountains and valleys that are the result of geologic, stratigraphic, and structural control. The present topography and landforms, however, are primarily the result of events during Quaternary time. The kinds of soil that formed are indicative of the stability and age of the surfaces of the landforms on which they occur.

Climate

The climate of the survey area is characterized by warm, dry summers and cool, moist winters. The average annual precipitation ranges from about 7 inches in the lowest elevations of the valleys to about 16 inches or more at the highest elevations in

the Snake Mountains, Browns Bench, The Granite Range, and the Delano Mountains. The average annual air temperature ranges from about 51 degrees F. in the lower elevation areas to about 41 degrees F. or lower in some of the high mountain ranges.

Major climatic variations are the result of the effects of topography and relief. Temperature decreases with increasing elevation. Precipitation increases with increasing elevation and is highest in the mountainous areas. As a consequence, the soils in the survey area reflect a general zonation with respect to elevation and longitudinal location.

The valleys in the survey area at elevations of 4,800 to 6,700 feet have an average annual precipitation of 7 to 14 inches. With increasing elevation there is an accompanying increase in precipitation which results in deeper leaching of salts and calcium carbonate, decreased reaction, changes in the kind and density of vegetation, and a thicker and darker A horizon.

At the highest elevations, up to about 8,800 feet, precipitation is 12 to over 16 inches. Leaching of salts and carbonates is more intensive. The soils are neutral or slightly acid with a thick A horizon that is high in organic matter content. Aridic Haploxerolls (Loncan series), Pachic Cryoborolls (Hapgood series), and Argic Pachic Cryoborolls (Tusel series) are typical of these soils.

In winter, freezing and thawing generally occur throughout the survey area, except in those areas that generally are insulated by snow cover. The effects of frost action are discernible by the heaving of plants, development of miniature stone rings, and erosion of the surface soil. At some of the higher elevations freezing and thawing has fractured and displaced the bedrock.

Living Organisms

Plants, animals, insects and microorganisms are important biological forces that affect soil formation in the survey area. Animals, such as badgers and

ground squirrels, and insects, such as cicadas, have had some effect on soil development, although plants appear to have been the major biological influence on the soils in this survey area.

The vegetation in the area has been a particularly important factor in reducing erosion. This factor has helped to maintain the stability of the land surfaces so that normal soil formation could take place.

Because of climatic differences, plants vary considerably in kinds and amounts with differences in elevation. On alluvial flats and fan skirts at low elevations, the main plants are salt-tolerant shrubs and grasses. Because of the salinity of these soils, plants cover only a small part of the surface. Therefore, very little organic matter is added to the soil and the scarcity of plants or litter provides little protection from the wind and sun. This is common in the Aeric Halaquepts (Ocala series) and Durorthidic Torriorthents (Batan series). Salt-tolerant shrubs also tend to recycle salts from the deeper layers to the soil surface.

On the floodplains where drainage is restricted, the dense growth of meadow vegetation has supplied the organic matter that gives the Cumulic Haplaquolls (Devilsgait and Welch series) a thick, dark-colored A horizon.

The piedmonts and hills at higher elevations support a plant cover of shrubs and grass that is transitional from desert shrubs. The density of plants is somewhat greater, soluble salts are deeper in the soil profile, and the A horizons of these soils have accumulated slight to moderate amounts of organic matter depending on soil stability. Xerollic Durargids (Hunnton series) and Lithic Xerollic Haplargids (Soughe series) are typical of these soils.

The mountainous areas support denser stands of shrubs, grasses, and in some places, trees. Because of the more abundant vegetation, the A horizons of most of the soils, such as the Pachic Argixerolls (Bullump series), are thick, high in organic matter, and dark in color.

Topography

Topography, through its effects on drainage, runoff, erosion, and exposure to the sun and wind, has had an important effect on soil formation in the survey area. The mountain ranges, valleys, and flood plains reflect the gross variations in relief within the area.

The mountain ranges are mainly characterized by excessive relief. Runoff is rapid and very rapid, and the hazard of erosion is high. The removal of

material by erosion inhibits or prevents soil development. Development in soils on unstable mountain surfaces that are subject to a high rate of geologic erosion is primarily limited to accumulation of organic matter to form a dark colored A horizon. A cambic or an argillic horizon has formed in the soils on more stable mountain surfaces where the rate of geologic erosion has been slower. Lithic Xerollic Haplargids (Soughe series) and Aridic Argixerolls (Sumine series) are examples of soils on stable mountain slopes where soil formation has been able to act on parent material long enough for argillic horizons to develop.

Soils on concave and north-facing mountain slopes commonly have snow that remains into late spring and early summer. The effect of temperature and moisture is enhanced in these areas, resulting in dense stands of shrubs and grass. The soils in these areas have developed a thick, dark-colored A horizon with a high content of organic matter. Pachic Cryoborolls (Hapgood series) are examples of these soils.

The northeast corner of the survey area is characterized by gently sloping plateaus and hills. The plateaus have broad summits and steep, fault escarpment side slopes. They consist of tertiary sedimentary rocks and ashy tuffs. Typic Vitrandepts (Bluehill series) and Xeric Durandeps (Tomsherry series) are examples of soils on plateaus. The hills have crests and steep side slopes. They mainly consist of ashy tuffs, welded tuffs, and rhyolite. Lithic Argixerolls (Shalper series), Mollic Vitrandepts (Zark series) and Mollic Hapoxeralfs (Xerxes series) are examples of soils on hills.

The valleys are either semi-bolson or bolsons that receive drainage water primarily from the surrounding mountain ranges. Within the survey area, the valleys are characterized by a series of level or nearly level basin floors consisting of floodplains or lake plains bordered by a piedmont slope consisting of fan skirts and fan piedmonts. They consist of Quaternary valley-fill material and tertiary tuffaceous sedimentary rocks.

In the valleys of the survey area stream erosion has dissected the valley fill and tuffaceous sedimentary rock, except in the southeast corner of the survey area. Downcutting of the valleys has been interrupted several times and these events are marked by the development of fan piedmonts. The dissection patterns in some of these areas have resulted in fan piedmont remnant summits and side slopes with inset fans and floodplains along drainageways. The fan piedmont areas have been relatively stable over a long period of time as a

result of the bypassing of drainage water from hills and mountains through dissection channels. Xerollic Durorthids (Chiara series), Xerollic Durargids (Hunnton and Chuska series) and Aridic Durixerolls (Cameek and Stampede series) are examples of soils on stable fan piedmonts. Durixerollic Camborthids (Enko and Orovada series) and drained Cumulic Haplaquolls (Welch series) are examples of soils on inset fans and floodplains.

The valley bottoms in the southeast corner of the survey area are not dissected. The valley fill material is generally very high in silt. This area has been greatly affected by ancient Lake Bonneville. They are characterized by a piedmont slope consisting of fan skirts, lake plains, sand dunes and offshore bars. Typic Calciorthids (Gravier and Loray series) are examples of soils on fan skirts. Aquic Torriorthents (Ixian series) and Typic Torriorthents (Sondoa series) are examples of soils found on lake plains. Typic Torripsamments (Kawich series) are examples of soils found on sand dunes. Typic Paleorthids (Luap series) are examples of soils found on offshore bars.

The level and nearly level alluvial flats and lower floodplains are in areas that have accumulated soluble salts. Runoff is slow and drainage is somewhat restricted. The soils in this area are light colored and contain soluble salts. Aeris Halaquepts (Ocala series) are examples of soils that formed in this area.

The nearly level floodplains in the survey area have a high water table. Runoff is very slow and some of the soils are subject to flooding. The soils in these areas support dense stands of meadow vegetation that have contributed a large amount of organic matter to the soils, producing a dark-colored A horizon. Cumulic Haplaquolls (Devilsgait and Welch series) are examples of these soils. In some areas, where stream channel entrenchment is common, the water table is at a greater depth. The soils in these areas support basin big sagebrush and basin wildrye and where irrigated support good stands of meadow vegetation. These soils also have dark-colored A horizons. The drained Cumulic Haplaquolls (Devilsgait series) are examples of soils found on floodplains where channel entrenchment is common.

Parent Material

Parent material is the weathered rock or unconsolidated material from which soils form. The hardness, grain size, and porosity of the parent material and its mineralogical and chemical

composition greatly influence soil formation. The main sources of parent material in the survey area are intrusive and extrusive igneous rock, sedimentary rock, lacustrine sediments, and eolian material, including loess and volcanic ash. Minor amounts of metamorphic rocks are present in localized areas.

The igneous rocks of the survey area mainly consists of rhyolite, basalt, welded and nonwelded tuffs. The igneous rocks contain appreciable quantities of minerals that weather to clay. The more siliceous rock, particularly tuff, is also a source of silica for the cementation of soil horizons. Because of the ability of material derived from volcanic rock to produce clay upon weathering, most soils that formed in this material that are on sufficiently stable landforms for long periods of time, have developed argillic horizons. Aridic Argixerolls (Sumine and Cotant series), Lithic Argixerolls (Cleavage series), and Lithic Xerollic Haplargids (Soughe series) are examples of these soils.

Colluvium has accumulated on steep mountain slopes as a result of gravitational forces and is a soil parent material. The colluvium generally is poorly sorted, contains many rock fragments, and includes minerals that weather to clay. Many of the colluvial landscapes have not been stable long enough for an argillic horizon to have formed in soils such as the Pachic Cryoborolls (Hapgood and Hackwood series).

Ordovician through Triassic age sedimentary rock occurs in mountains and hills throughout the survey area. This bedrock consists of relatively thick sequences of chert, shale, siltstone, sandstone, conglomerate and limestone. Typic Calcixerolls (Cavehill series) are examples of soils that have developed calcic horizons. Lithic Xeric Torriorthents (Hopeka series) are examples of shallow, undeveloped soils on unstable land surfaces where an argillic horizon has not formed.

Late Tertiary sedimentary rock occurs in valleys and hills throughout the survey area. The bedrock consists primarily of older alluvium and lakebed deposits containing interbedded tuffaceous shale, tuffaceous sandstone, siltstone and mudstone. Xeric Torriorthents (Puett and Hundraw series) are examples of shallow and moderately deep undeveloped soils on unstable surfaces where soil formation is minimal.

Alluvium deposited as piedmont slopes and basin floors consists of sandy, silty and clayey material of generally mixed mineralogy that has been eroded from surrounding hills and mountains.

Alluvium deposited from mixed rock sources on mountain valley fans, alluvial fans, fan piedmonts

and fan skirts are sandy, loamy and silty textured and generally contain pebbles, cobbles, and stones. It is porous and, except in areas that are highly calcareous, contains minerals that, when weathered, produce clay and soluble silica for cementation of duripans. The highly calcareous materials, when weathered, commonly form calcic and petrocalcic horizons. Pachic Argixerolls (Arva series) are examples of soils on mountain valley fans which tend to be in areas of higher elevation. Durixerollic Haplargids (Wieland series) and Xerollic Durargids (Hunnton series) are examples of soils with an argillic horizon and silica cementation that formed on stable fan piedmonts. Xerollic Durorthids (Chiara series) are examples of soils on stable alluvial fans. Durixerollic Camborthids (Enko series) are examples of soils with a cambic horizon and some silica cementation on fan piedmonts and fan skirts. Aridic Calcixerolls (Pamison series) and Xerollic Paleorthids (Pibler series) are examples of soils with calcic and petrocalcic horizons on fan piedmonts.

Alluvium deposited below the fan piedmonts as alluvial flats and floodplains consists of sandy, silty and clayey material. Soluble salts are common in some of these soils. Although these materials contain weatherable minerals, the soils are young and do not exhibit appreciable soil development. Aeric Halaquepts (Ocala series) and Cumulic Haplaquolls (Devilsgait series) are examples of these soils.

Volcanic ash and eolian material has been instrumental as a source of silica in the formation of durinodes and duripans in the soils of the area. Durixerollic Camborthids (Kelk series) on fan skirts and inset fans and Aeric Halaquepts (Ocala series) on alluvial flats and floodplains are examples of these soils.

Time

Time is required for the formation of soil horizons. The amount of time required depends upon the other soil-forming factors. Thickness and other characteristics of A and B horizons and other horizons reflect the relative age of soils. The strength of expression of the soil horizons is a reflection of the amount of weathering of parent material resulting from the interaction of moisture, temperature, and biological activity as influenced by time.

The soils in this survey area range from a few years to possibly a few hundred thousand years or

more in age. This range in age is a major reason for the many kinds of soil in the area.

The influence of time and other soil-forming factors are not well understood by soil scientists and geologists working in this field. Many soil scientists and some geologists feel that weathering of parent material and soil profile development have been essentially continuous, with little change in rate throughout Quaternary time (I2), (I3), (I7).

Recently, geologists concerned with differentiating Quaternary deposits have proposed that soil development has not proceeded continuously at the same rate, but has taken place intermittently at rapid rates (9), (10), (11), (I6). These geologists have developed the technique of mapping soil stratigraphic units which use weathering profiles as stratigraphic markers to differentiate and correlate Quaternary deposits. The concept of soil development is based on the assumption that weathering profiles formed in response to infrequent combinations of climatic factors that induced minimal erosion and deposition and a greatly accelerated rate of chemical weathering.

Although disagreements exist in regard to the relative influences of time and other soil-forming factors, the concept of intermittency of soil formation has been supported by numerous studies and provides a practical technique to discuss the age of soil in the survey area in relation to geologic climatic units in Quaternary time. For the purposes of this discussion, time-stratigraphic names will be as set forth by Birkeland (3). These are Holocene (0-10,000 years), Late Wisconsin (10,000-30,000 years), Middle Wisconsin (30,000-40,000 years), Early Wisconsin (40,000-130,000 years), and pre-Wisconsin (130,000+ years).

The kinds of diagnostic subsurface horizons and other subsurface diagnostic properties (20), together with their strength of expression, provide general clues to the age of the soils in the area. Important subsurface diagnostic horizons present in soils within the area include argillic, natric, and cambic horizons, horizons exhibiting silica cementation, calcic and petrocalcic horizons.

Prominent argillic horizons in this area occur generally only in soils that formed primarily during Wisconsin and pre-Wisconsin. This concept has been established by studies in the Southwest (5), (6) and is further supported in Soil Taxonomy (20). With increasing age and constancy of other conditions, argillic horizons become finer in texture, become somewhat thicker, and tend to develop abrupt upper boundaries. Weakly expressed, thin

argillic horizons may have formed during Late Wisconsin or Early Holocene time.

Natric horizons are special kinds of argillic horizons that formed under the influences of high exchangeable sodium content. The effect of sodium on the dispersion of clay may tend to accelerate the rate of formation of argillic horizons. This is not believed to be significant, however, except in weakly expressed natric horizons that formed on Holocene surfaces. Following earlier development as argillic horizons, prominent natric horizons may have developed their present characteristics as a result of sodium supplied with eolian deposits. Transportation and deposition of sodium salts with eolian deposits are believed to be an important present-day process that affects the physical and chemical properties of soils in the area.

Calcic horizons are horizons of accumulation of calcium carbonate. The calcium is considered to have originated from carbonate in the parent material or from eolian deposits. In this area, calcic horizons in soils with highly calcareous parent material generally formed primarily in Holocene to Late Wisconsin time (3). Soils that formed under these conditions are usually weakly developed. Lithic Xerollic Calciorthids (Amtoft) and Typic Calciorthids (Gravier and Loray series) are examples of soils formed under these conditions.

Petrocalcic horizons form when a calcic horizon becomes plugged with carbonates and cemented into a hard, massive and continuous horizon. The petrocalcic horizon is a mark of advanced soil formation and in this area formed primarily in pre-Wisconsin time (3). Xerollic Paleorhids (Pibler series) and Typic Paleorhids (Luap series) are examples of these soils.

The volcanic glass in sediment derived from pyroclastic material and in alluvial and eolian deposits of volcanic ash is a source of silica for the formation of duripans and durinodes in many of the soils in the survey area. Duripans are massive or platy horizons that are cemented with silica and, in most instances, with accessory carbonates. Because of their association with prominent argillic horizons, massive duripans capped with silica and lime cemented laminar layers are probably the oldest kind of duripan in the area and are of pre-Wisconsin age. Thin duripans lacking overlying laminar layers, weak discontinuous silica cementation, and/or durinodes have apparently developed on Holocene surfaces in loess or loamy alluvium generally deposited on gravely material. These forms of silica cementation apparently are capable of forming during a relatively

short period of time and are probably less than 7,000 years old.

The degree of development of diagnostic subsurface horizons in the soils of the area indicates a sequence that ranges in age from present late Holocene to pre-Wisconsin.

The youngest soils in the area are those that formed in recently aggraded material or in material recently exposed by erosion. Included among these soils are shallow Xeric Torriorthents (Puett and Grina series) formed in Tertiary sediments on low hills where geologic erosion has been active.

Somewhat older than the youngest soils are soils that formed in alluvium on wet floodplains, slowly aggrading inset fans and soils on relatively recently eroded mountain slopes. These soils have been stable long enough to have accumulated organic matter and formed a dark-colored A horizon. They do not have an argillic, natric, cambic or calcic horizons, duripans or durinodes. They are probably less than about 1,000 years old. Cumulic Haplaquolls (Welch series) are examples of soils that formed on wet floodplains. Aridic Haploxerolls (Loncan series) and Lithic Haploxerolls (Agassiz series) are examples of soils that formed on mountain slopes.

Soils that formed in alluvium and have developed subsurface horizons containing durinodes or horizons with very weak silica cementation are also older than the youngest soils and possibly are slightly older than the soils that have developed a dark-colored A horizon as their only diagnostic feature. These soils formed in saline and alkali affected parent material containing appreciable amounts of volcanic ash and are on alluvial flats, axial-stream floodplains and fan skirts. The volcanic ash as a source of soluble silica along with the alkaline reaction, probably contributes to relatively rapid formation of durinodes and incipient silica cementation. Aerice Halaquepts (Ocala series) and Durorthidic Torriorthents (Batan series) are examples of soils that have horizons with incipient silica cementation.

Stable Holocene land surfaces less than about 10,000 years and more than 2,000 years old are extensive in the survey area. The soils that formed on these surfaces have a cambic horizon. Cambic horizons in soils within the area formed for the most part in mixed alluvium. Original stratification is absent, and carbonates and some silica have been removed and redeposited in underlying horizons. Investigations in southern New Mexico indicate that cambic horizons in that region are less than about 5,000 years old (4), (7). Cambic horizons in the survey area and in other areas in Nevada have been

generally thought to be less than 10,000 years old, and possibly less than 7,000 years. This age has been determined mostly as a result of soil mapping in areas located below the last high stage of Pleistocene Lake Lahontan (8), (9), (10), (11). Durixerollic Camborthids (Enko, Kelk and Orovada series) are examples of soils with cambic horizons on fan piedmont remnants, inset fans, fan skirts, fan aprons, and partial ballenas.

The landscape in some areas is less stable and have been stripped by subsequent erosion during Late Wisconsin Time, exposing relict duripans. Following redeposition during middle to early Holocene, loess and loamy alluvium derived from surrounding land surfaces covered these relict subsurface horizons to a shallow depth. Soil development of the surface alluvium is minimal. Xerollic Durorthids (Chiara and Peeko series) are examples of these soils on fan piedmonts and partial ballenas.

Soils that have a relict argillic horizon are believed to be of Late Wisconsin to pre-Wisconsin age. These soils occur extensively on mountains, hills and fan piedmonts. The fact that extensive areas of these kinds of soils exist today is evidence that major erosional and depositional events have not taken place or have been minor in extent since late Pleistocene time.

Stable Early-Late Wisconsin or Middle Wisconsin land surfaces are extensive. These soils have

dominantly fine-loamy or loamy-skeletal argillic horizons. Durixerollic Haplargids (Nevador series) are an example of soils with argillic horizons on fan piedmonts. Lithic Argixerolls (Cleavage series) is an example of soil with argillic horizons on hill and mountain side slopes. Aridic Argixerolls (Sumine series) are examples of soils on mountain side slopes.

Stable Early Wisconsin or Early-Middle Wisconsin land surfaces are extensive. These soils have well developed, fine textured argillic or natric horizons. They occupy older, stable land surfaces where the original subsurface horizons have been neither stripped by erosion or deeply buried by sediment. Aridic Durixerolls (Stampede series) and Xerollic Durargids (Hunnton series) are examples of these soils on fan piedmonts. Aridic Argixerolls (Lerrow series) are examples of these soils on mountain slopes.

Stable very Early Wisconsin and pre-Wisconsin surfaces are moderately extensive in the area. These surfaces are relatively stable, deeply dissected, and have fine and very fine textures with an argillic horizon that has an abrupt upper boundary. It is because of these characteristics that these soils are considered to be the oldest in the area. Abruptic Aridic Durixerolls (Donna series) are examples of these soils on fan piedmonts.

Glossary

Aeration, soil. The exchange of air in soil with air from the atmosphere. The air in a well aerated soil is similar to that in the atmosphere; the air in a poorly aerated soil is considerably higher in carbon dioxide and lower in oxygen.

Aggregate, soil. Many fine particles held in a single mass or cluster. Natural soil aggregates, such as granules, blocks, or prisms, are called peds. Clods are aggregates produced by tillage or logging.

Alkali (sodic) soil. A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

Alluvial cone. The material washed down the sides of mountains and hills by ephemeral streams and deposited at the mouth of gorges in the form of a moderately steep, conical mass descending equally in all directions from the point of issue.

Alluvial fan. The fanlike deposit of a stream where it issues from a narrow valley upon a plain, or of a tributary stream near or at its junction with its main stream.

Alluvial flat. A nearly level, graded, alluvial surface in bolsons and semi-bolsons. Commonly, an alluvial flat does not manifest terraces or floodplain levels.

Alluvium. Material, such as sand, silt, or clay, deposited on land by streams.

Alpha,alpha-dipridyl. A dye that when dissolved in 1N ammonium acetate is used to detect the presence of reduced iron (Fe II) in the soil. A positive reaction indicates a type of redoximorphic feature.

Animal unit month (AUM). The amount of forage required by one mature cow of approximately 1,000 pounds weight, with or without a calf, for 1 month.

Aquic conditions. Current soil wetness characterized by saturation, reduction, and redoximorphic features.

Area reclaim (in tables). An area difficult to reclaim after the removal of soil for construction and other

uses. Revegetation and erosion control are extremely difficult.

Argillic horizon. A subsoil horizon characterized by an accumulation of illuvial clay.

Argillite. Weakly metamorphosed mudstone or shale.

Arroyo. The flat-floored channel of an ephemeral stream, commonly with very steep to vertical banks cut in alluvium.

Aspect. The direction in which a slope faces.

Association, soil. A group of soils or miscellaneous areas geographically associated in a characteristic repeating pattern and defined and delineated as a single map unit.

Available water capacity (available moisture capacity). The capacity of soils to hold water available for use by most plants. It is commonly defined as the difference between the amount of soil water at field moisture capacity and the amount at wilting point. It is commonly expressed as inches of water per inch of soil. The capacity, in inches, in a 60-inch profile or to a limiting layer is expressed as:

Very low	0 to 3.5
Low	3.5 to 5
Moderate	5 to 7.5
High	more than 7.5

Avalanche chute. The track or path formed by an avalanche.

Back slope. The geomorphic component that forms the steepest inclined surface and principal element of many hillsides. Back slopes in profile are commonly steep, are linear, and may or may not include cliff segments.

Backswamp. A floodplain landform of extensive, marshy, or swampy, depressed areas of flood plains between natural levees and valley sides or terraces.

Badland. Steep or very steep, commonly nonstony, barren land dissected by many intermittent drainage channels. Badland is most common in semiarid and arid regions where streams are

entrenched in soft geologic material. Local relief generally ranges from 25 to 500 feet. Runoff potential is very high, and geologic erosion is active.

Ballena. A fan remnant having a distinctively-rounded surface of fan alluvium. The ballena's broadly rounded shoulders meet from either side to form a narrow summit and merge smoothly with concave, short pediments which form smoothly-rounded drainageways between adjacent ballenas. A partial ballena is a fan remnant large enough to retain some relict fan surface on a remnant summit.

Barrier beach. A wide gently sloping portion of a bolson floor comprising numerous, parallel, relict longshore-bars and lagoons built by a receding pluvial lake.

Basal area. The area of a cross section of a tree, generally referring to the section at breast height and measured outside the bark. It is a measure of stand density, commonly expressed in square feet.

Base saturation. The degree to which material having cation-exchange properties is saturated with exchangeable bases (sum of Ca, Mg, Na, K), expressed as a percentage of the total cation-exchange capacity.

Basin floor. A general term for the nearly level, lower-most part of intermontane basins (i.e., bolson, semi-bolsions). The basin floor includes all of the alluvial, eolian, and erosional landforms below the piedmont slope.

Beach terrace. The relict shorelines from pluvial lakes, generally restricted to valley sides.

Bedding planes. Fine strata, less than 5 millimeters thick, in unconsolidated alluvial, eolian, lacustrine, or marine sediment.

Bedding system. A drainage system made by plowing, grading, or otherwise shaping the surface of a flat field. It consists of a series of low ridges separated by shallow, parallel dead furrows.

Bedrock. The solid rock that underlies the soil and other unconsolidated material or that is exposed at the surface.

Bedrock-controlled topography. A landscape where the configuration and relief of the landforms are determined or strongly influenced by the underlying bedrock.

Bench terrace. A raised, level or nearly level strip of earth constructed on or nearly on a contour, supported by a barrier of rocks or similar material, and designed to make the soil suitable for tillage and to prevent accelerated erosion.

Bisequum. Two sequences of soil horizons, each of which consists of an illuvial horizon and the overlying eluvial horizons.

Blowout. A shallow depression from which all or most of the soil material has been removed by wind. A blowout has a flat or irregular floor formed by a resistant layer or by an accumulation of pebbles or cobbles. In some blowouts, the water table is exposed.

Board foot. A unit of measure of the wood in lumber, logs, or trees. The amount of wood in a board one foot wide, one foot long, and one inch thick before finishing.

Bolson. A landscape term for an internally drained intermontane basin into which drainages from surrounding mountains converge inward toward a central depression.

Boulders. Rock fragments larger than 2 feet (60 centimeters) in diameter.

Breaks. The steep and very steep broken land at the border of an upland summit that is dissected by ravines.

Breast height. An average height of 4.5 feet above the ground surface; the point on a tree where diameter measurements are ordinarily taken.

Brush management. Use of mechanical, chemical, or biological methods to make conditions favorable for reseeding or to reduce or eliminate competition from woody vegetation and thus allow understory grasses and forbs to recover. Brush management increases forage production and thus reduces the hazard of erosion. It can improve the habitat for some species of wildlife.

Butte. An isolated small mountain or hill with steep or precipitous sides and a top variously flat, rounded, or pointed that may be a residual mass isolated by erosion or an exposed volcanic neck.

Calcareous soil. A soil containing enough calcium carbonate (commonly combined with magnesium carbonate) to effervesce visibly when treated with cold, dilute hydrochloric acid.

Caldera. A large, more or less circular depression, formed by explosion and/or collapse, which surrounds a volcanic vent or vents, and whose diameter is much greater than that of the included vent, or vents.

Caliche. A more or less cemented deposit of calcium carbonate in soils of warm-temperate, subhumid to arid areas. Caliche occurs as soft, thin layers in the soil or as hard, thick beds directly beneath the solum, or it is exposed at the surface by erosion.

California bearing ratio (CBR). The load-supporting capacity of a soil as compared to that of a standard crushed limestone, expressed as a ratio. First standardized in California. A soil having a CBR of 16 supports 16 percent of the load that would be

supported by standard crushed limestone, per unit area, with the same degree of distortion.

Canopy. The leafy crown of trees or shrubs. (See Crown.)

Canyon. A long, deep, narrow, very steep sided valley with high, precipitous walls in an area of high local relief.

Capillary water. Water held as a film around soil particles and in tiny spaces between particles. Surface tension is the adhesive force that holds capillary water in the soil.

Catena. A sequence, or "chain," of soils on a landscape that formed in similar kinds of parent material but have different characteristics as a result of differences in relief and drainage.

Cation. An ion carrying a positive charge of electricity. The common soil cations are calcium, potassium, magnesium, sodium, and hydrogen.

Cation-exchange capacity. The total amount of exchangeable cations that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. The term, as applied to soils, is synonymous with base-exchange capacity but is more precise in meaning.

Channeled. Refers to a drainage area in which natural meandering or repeated branching and convergence of a streambed have created deeply incised cuts, either active or abandoned, in alluvial material.

Channery soil material. Soil material that is, by volume, 15 to 35 percent thin, flat fragments of sandstone, shale, slate, limestone, or schist as much as 6 inches (15 centimeters) along the longest axis. A single piece is called a channer.

Chemical treatment. Control of unwanted vegetation through the use of chemicals.

Chiseling. Tillage with an implement having one or more soil-penetrating points that shatter or loosen hard, compacted layers to a depth below normal plow depth.

Clay. As a soil separate, the mineral soil particles less than 0.002 millimeter in diameter. As a soil textural class, soil material that is 40 percent or more clay, less than 45 percent sand, and less than 40 percent silt.

Clay depletions. Low-chroma zones having a low content of iron, manganese, and clay because of the chemical reduction of iron and manganese and the removal of iron, manganese, and clay. A type of redoximorphic depletion.

Clayey soil. Silty clay, sandy clay, or clay.

Clay film. A thin coating of oriented clay on the surface of a soil aggregate or lining pores or root channels. Synonyms: clay coating, clay skin.

Claypan. A slowly permeable soil horizon that contains much more clay than the horizons above it. A claypan is commonly hard when dry and plastic or stiff when wet.

Clearcut. A method of forest harvesting that removes the entire stand of trees in one cutting. Reproduction is achieved artificially or by natural seeding from adjacent stands.

Climax plant community. The stabilized plant community on a particular site. The plant cover reproduces itself and does not change so long as the environment remains the same.

Closed depression. A low area completely surrounded by higher ground and having no natural outlet.

Coarse fragments. Mineral or rock particles larger than 2 millimeters in diameter.

Coarse textured soil. Sand or loamy sand.

Cobble (or cobblestone). A rounded, partly rounded, or angular fragment of rock 3 to 10 inches (7.6 to 25 centimeters) in diameter.

Cobbly soil material. Material that is 15 to 35 percent, by volume, rounded or partially rounded rock fragments 3 to 10 inches (7.6 to 25 centimeters) in diameter. Very cobbly soil material is 35 to 60 percent of these rock fragments, and extremely cobbly soil material is more than 60 percent.

Codominant trees. Trees whose crowns form the general level of the forest canopy and that receive full light from above but comparatively little from the sides.

Colluvium. Unconsolidated, unsorted earth material moved and deposited by mass movement on sideslopes and at the base of slopes.

Commercial forest. Forest land capable of producing 20 cubic feet or more per acre per year at the culmination of mean annual increment.

Complex slope. Irregular or variable slope. Planning or establishing terraces, diversions, and other water-control structures on a complex slope is difficult.

Complex, soil. A map unit of two or more kinds of soil or miscellaneous areas in such an intricate pattern or so small in area that it is not practical to map them separately at the selected scale of mapping. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas.

Compressible (in tables). Excessive decrease in volume of soft soil under load.

Concretions. Cemented bodies with crude internal symmetry organized around a point, a line, or a plane that typically takes the form of concentric

layers visible to the naked eye. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up concretions. If formed in place, concretions of iron oxide or manganese oxide are generally considered a type of redoximorphic concentration.

Conglomerate. A coarse grained, clastic rock composed of rounded to subangular rock fragments more than 2 millimeters in diameter. It commonly has a matrix of sand and finer textured material. Conglomerate is the consolidated equivalent of gravel.

Conservation cropping system. Growing crops in combination with needed cultural and management practices. In a good conservation cropping system, the soil-improving crops and practices more than offset the soil-depleting crops and practices. Cropping systems are needed on all tilled soils. Soil-improving practices in a conservation cropping system include the use of rotations that contain grasses and legumes and the return of crop residue to the soil. Other practices include the use of green manure crops of grasses and legumes, proper tillage, adequate fertilization, and weed and pest control.

Conservation tillage. A tillage system that does not invert the soil and that leaves a protective amount of crop residue on the surface throughout the year.

Consistence, soil. Refers to the degree of cohesion and adhesion of soil material and its resistance to deformation when ruptured. Consistence includes resistance of soil material to rupture and to penetration; plasticity, toughness, and stickiness of puddled soil material; and the manner in which the soil material behaves when subject to compression. Terms describing consistence are defined in the "Soil Survey Manual."

Contour stripcropping. Growing crops in strips that follow the contour. Strips of grass or close-growing crops are alternated with strips of clean-tilled crops or summer fallow.

Control section. The part of the soil on which classification is based. The thickness varies among different kinds of soil, but, for many, it is that part of the soil profile between depths of 10 inches and 40 or 80 inches.

Coprogenous earth (sedimentary peat). Fecal material deposited in water by aquatic organisms.

Corrosion. Soil-induced electrochemical or chemical action that dissolves or weakens concrete or uncoated steel.

Cover crop. A close-growing crop grown primarily to improve and protect the soil between periods of

regular crop production, or a crop grown between trees and vines in orchards and vineyards.

Cropping system. Growing crops according to a planned system of rotation and management practices.

Crop residue management. Returning crop residue to the soil, which helps to maintain soil structure, organic matter content, and fertility and helps to control erosion.

Cross-slope farming. Deliberately conducting farming operations on sloping farmland in such a way that tillage is across the general slope.

Crown. The upper part of a tree or shrub, including the living branches and their foliage.

Cuesta. A hill or ridge that has a gentle slope on one side and a steep slope on the other; specifically, an asymmetric, homoclinal ridge capped by resistant rock layers of slight or moderate dip.

Culmination of the mean annual increment (CMAI).

The average annual increase per acre in the volume of a stand. Computed by dividing the total volume of the stand by its age. As the stand increases in age, the mean annual increment continues to increase until mortality begins to reduce the rate of increase. The point where the stand reaches its maximum annual rate of growth is called the culmination of the mean annual increment.

Cutbanks cave (in tables). The walls of excavations tend to cave in or slough.

Decreasers. The most heavily grazed climax range plants. Because they are the most palatable, they are the first to be destroyed by overgrazing.

Deep soil. A soil that is 40 to 60 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Deferred grazing. Postponing grazing or resting grazing land for a prescribed period.

Delta. A body of alluvium having a surface that is nearly flat and fan shaped, deposited at or near the mouth of a river or stream where it enters a body of relatively quiet water, generally a sea or lake.

Dense layer (in tables). A very firm, massive layer that has a bulk density of more than 1.8 grams per cubic centimeter. Such a layer affects the ease of digging and can affect filling and compacting.

Depth, soil. Generally, the thickness of the soil over bedrock. Very deep soils are more than 60 inches deep over bedrock; deep soils, 40 to 60 inches; moderately deep, 20 to 40 inches; shallow, 10 to 20 inches; and very shallow, less than 10 inches.

Depth to rock (in tables). Bedrock is too near the surface for the specified use.

Desert pavement. On a desert surface, a layer of gravel or larger fragments that was emplaced by upward movement of the underlying sediments or that remains after finer particles have been removed by running water or the wind.

Dip slope. A slope of the land surface, roughly determined by and approximately conforming to the dip of the underlying bedrock.

Diversion (or diversion terrace). A ridge of earth, generally a terrace, built to protect downslope areas by diverting runoff from its natural course.

Divided-slope farming. A form of field stripcropping in which crops are grown in a systematic arrangement of two strips, or bands, across the slope to reduce the hazard of water erosion. One strip is in a close-growing crop that provides protection from erosion, and the other strip is in a crop that provides less protection from erosion. This practice is used where slopes are not long enough to permit a full stripcropping pattern to be used.

Dominant trees. Trees whose crowns form the general level of the forest canopy and that receive full light from above and from the sides.

Drainage class (natural). Refers to the frequency and duration of wet periods under conditions similar to those under which the soil formed. Alterations of the water regime by human activities, either through drainage or irrigation, are not a consideration unless they have significantly changed the morphology of the soil. Seven classes of natural soil drainage are recognized: excessively drained, somewhat excessively drained, well drained, moderately well drained, somewhat poorly drained, poorly drained, and very poorly drained. These classes are defined in the "Soil Survey Manual."

Drainage, surface. Runoff, or surface flow of water, from an area.

Drainageway. An area of ground at a lower elevation than the surrounding ground and in which water collects and is drained to a closed depression or lake or to a drainageway at a lower elevation. A drainageway may or may not have distinctly incised channels at its upper reaches or throughout its course.

Duff. A generally firm organic layer on the surface of mineral soils. It consists of fallen plant material that is in the process of decomposition and includes everything from the litter on the surface to underlying pure humus.

Dune. A mound, ridge, or hill of loose, windblown granular material (generally sand), either bare or covered with vegetation.

Ecological Site. A distinctive kind of rangeland or grazed forestland that has a unique historic potential native plant community. Ecological sites are the products of all the environmental factors that affect their development. An ecological site is capable of supporting a native plant community that has a unique kind and/or proportion of species or total vegetative production. Ecological sites in grazed forestland include both overstory and understory vegetation.

Effervescence. The quality of a soil measured when drops of diluted (1:10) hydrochloric acid (HCL) are added to the soil. The ratings are as follows:

Very slightly effervescent few bubbles
Slightly effervescent bubbles readily
Strongly effervescent bubbles form low foam
Violently effervescent bubbles form thick foam quickly

Eluviation. The movement of material in true solution or colloidal suspension from one place to another within the soil. Soil horizons that have lost material through eluviation are eluvial; those that have received material are illuvial.

Endosaturation. A type of saturation of the soil in which all horizons between the upper boundary of saturation and a depth of 2 meters are saturated.

Eolian soil material. Earthy parent material accumulated through wind action; commonly refers to sandy material in dunes or to loess in blankets on the surface.

Ephemeral stream. A stream, or reach of a stream, that flows only in direct response to precipitation. It receives no long-continued supply from melting snow or other source, and its channel is above the water table at all times.

Episaturation. A type of saturation indicating a perched water table in a soil in which saturated layers are underlain by one or more unsaturated layers within 2 meters of the surface.

Erosion. The wearing away of the land surface by water, wind, ice, or other geologic agents and by such processes as gravitational creep.

Erosion (geologic). Erosion caused by geologic processes acting over long geologic periods and resulting in the wearing away of mountains and the building up of such landscape features as flood plains and coastal plains. Synonym: natural erosion.

Erosion (accelerated). Erosion much more rapid than geologic erosion, mainly as a result of human or animal activities or of a catastrophe in nature, such as a fire, that exposes the surface.

Erosion pavement. A layer of gravel or stones that remains on the surface after fine particles are removed by sheet or rill erosion.

Escarpment. A relatively continuous and steep slope or cliff breaking the general continuity of more gently sloping land surfaces and resulting from erosion or faulting. Synonym: scarp.

Even aged. Refers to a stand of trees in which only small differences in age occur between the individuals. A range of 20 years is allowed.

Excess alkali (in tables). Excess exchangeable sodium in the soil. The resulting poor physical properties restrict the growth of plants.

Excess fines (in tables). Excess silt and clay in the soil. The soil does not provide a source of gravel or sand for construction purposes.

Excess lime (in tables). Excess carbonates in the soil that restrict the growth of some plants.

Excess salts (in tables). Excess water-soluble salts in the soil that restrict the growth of most plants.

Excess sodium (in tables). Excess exchangeable sodium in the soil. The resulting poor physical properties restrict the growth of plants.

Excess sulfur (in tables). Excessive amount of sulfur in the soil. The sulfur causes extreme acidity if the soil is drained, and the growth of most plants is restricted.

Extrusive rock. Igneous rock derived from deep-seated molten matter (magma) emplaced on the earth's surface.

Fallow. Cropland left idle in order to restore productivity through accumulation of moisture. Summer fallow is common in regions of limited rainfall where cereal grain is grown. The soil is tilled for at least one growing season for weed control and decomposition of plant residue.

Fan apron. A sheet-like mantle of relatively young alluvium covering part of an older fan piedmont surface. It somewhere buries a soil that can be traced to the edge of the fan apron.

Fan piedmont. The most extensive landform on piedmont slopes, formed by the coalescence of alluvial fans or accretions of fan aprons into one generally smooth slope.

Fan remnant. A general term for landforms that are remaining parts of older fan-landforms, that either have been dissected or partially buried.

Fan skirt. The zone of smooth, laterally-coalescing, small alluvial fans that issue from gullies cut into the fan piedmont or that are the coalescing extensions of inset fans of the fan piedmont, and that merge with the basin floor.

Fast intake (in tables). The rapid movement of water into the soil.

Fertility, soil. The quality that enables a soil to provide plant nutrients, in adequate amounts and in proper balance, for the growth of specified plants when light, moisture, temperature, tilth, and other growth factors are favorable.

Fibric soil material (peat). The least decomposed of all organic soil material. Peat contains a large amount of well preserved fiber that is readily identifiable according to botanical origin. Peat has the lowest bulk density and the highest water content at saturation of all organic soil material.

Field moisture capacity. The moisture content of a soil, expressed as a percentage of the oven-dry weight, after the gravitational, or free, water has drained away; the field moisture content 2 or 3 days after a soaking rain; also called *normal field capacity*, *normal moisture capacity*, or *capillary capacity*.

Fill slope. A sloping surface consisting of excavated soil material from a road cut. It commonly is on the downhill side of the road.

Fine textured soil. Sandy clay, silty clay, or clay.

Firebreak. An area cleared of flammable material to stop or help control creeping or running fires. It also serves as a line from which to work and to facilitate the movement of fire fighters and equipment. Designated roads also serve as firebreaks.

First bottom. The normal flood plain of a stream, subject to frequent or occasional flooding.

Flaggy soil material. Material that is, by volume, 15 to 35 percent flagstones. Very flaggy soil material is 35 to 60 percent flagstones, and extremely flaggy soil material is more than 60 percent flagstones.

Flagstone. A thin fragment of sandstone, limestone, slate, shale, or (rarely) schist 6 to 15 inches (15 to 38 centimeters) long.

Flood plain. A nearly level alluvial plain that borders a stream and is subject to flooding unless protected artificially.

Fluvial. Of or pertaining to rivers; produced by river action, as a fluvial plain.

Foothill. A steeply sloping upland that has relief of as much as 1,000 feet (300 meters) and fringes a mountain range or high-plateau escarpment.

Foot slope. The inclined surface at the base of a hill.

Forb. Any herbaceous plant not a grass or a sedge.

Forest cover. All trees and other woody plants (underbrush) covering the ground in a forest.

Fragile (in tables). A soil that is easily damaged by use or disturbance.

Frost action (in tables). Freezing and thawing of soil moisture. Frost action can damage roads, buildings and other structures, and plant roots.

- Genesis, soil.** The mode of origin of the soil. Refers especially to the processes or soil-forming factors responsible for the formation of the solum, or true soil, from the unconsolidated parent material.
- Gilgai.** The microrelief of clayey soils that shrink and swell considerably with changes in moisture content. Usually manifested as a succession of microbasins and microknolls in nearly level areas or of microvalleys and microridges parallel with the slope.
- Gleyed soil.** Soil that formed under poor drainage, resulting in the reduction of iron and other elements in the profile and in gray colors.
- Graded stripcropping.** Growing crops in strips that grade toward a protected waterway.
- Grassed waterway.** A natural or constructed waterway, typically broad and shallow, seeded to grass as protection against erosion. Conducts surface water away from cropland.
- Gravel.** Rounded or angular fragments of rock as much as 3 inches (2 millimeters to 7.6 centimeters) in diameter. An individual piece is a pebble.
- Gravelly soil material.** Material that is 15 to 50 percent, by volume, rounded or angular rock fragments, not prominently flattened, as much as 3 inches (7.6 centimeters) in diameter.
- Green manure crop** (agronomy). A soil-improving crop grown to be plowed under in an early stage of maturity or soon after maturity.
- Ground water.** Water filling all the unblocked pores of underlying material below the water table.
- Gully.** A miniature valley with steep sides cut by running water and through which water ordinarily runs only after rainfall. The distinction between a gully and a rill is one of depth. A gully generally is an obstacle to farm machinery and is too deep to be obliterated by ordinary tillage; a rill is of lesser depth and can be smoothed over by ordinary tillage.
- Gypsum.** A mineral consisting of hydrous calcium sulfate.
- Hard bedrock.** Bedrock that cannot be excavated except by blasting or by the use of special equipment that is not commonly used in construction.
- Hardpan.** A hardened or cemented soil horizon, or layer. The soil material is sandy, loamy, or clayey and is cemented by iron oxide, silica, calcium carbonate, or other substance.
- Heavy metal.** Inorganic substances that are solid at ordinary temperatures and are not soluble in water. They form oxides and hydroxides that are basic. Examples are copper, iron, cadmium, zinc, manganese, lead, and arsenic.
- Hemic soil material (mucky peat).** Organic soil material intermediate in degree of decomposition between the less decomposed fibric material and the more decomposed sapric material.
- High-residue crops.** Such crops as small grain and corn used for grain. If properly managed, residue from these crops can be used to control erosion until the next crop in the rotation is established. These crops return large amounts of organic matter to the soil.
- Hill.** A natural elevation of the land surface, rising as much as 1,000 feet above surrounding lowlands, commonly of limited summit area and having a well defined outline; hillsides generally have slopes of more than 15 percent. The distinction between a hill and a mountain is arbitrary and is dependent on local usage.
- Holocene.** The epoch of the Quaternary Period of geologic time, extending from the end of the Pleistocene Epoch (about 10 to 12 thousand years ago) to the present.
- Horizon, soil.** A layer of soil, approximately parallel to the surface, having distinct characteristics produced by soil-forming processes. In the identification of soil horizons, an uppercase letter represents the major horizons. Numbers or lowercase letters that follow represent subdivisions of the major horizons. The major horizons of mineral soil are as follows:
- O horizon.*--An organic layer of fresh and decaying plant residue.
- A horizon.*--The mineral horizon at or near the surface in which an accumulation of humified organic matter is mixed with the mineral material. Also, a plowed surface horizon, most of which was originally part of a B horizon.
- E horizon.*--The mineral horizon in which the main feature is loss of silicate clay, iron, aluminum, or some combination of these.
- B horizon.*--The mineral horizon below an A horizon. The B horizon is in part a layer of transition from the overlying A to the underlying C horizon. The B horizon also has distinctive characteristics, such as (1) accumulation of clay, sesquioxides, humus, or a combination of these; (2) prismatic or blocky structure; (3) redder or browner colors than those in the A horizon; or (4) a combination of these.
- C horizon.*--The mineral horizon or layer, excluding indurated bedrock, that is little affected by soil-forming processes and does not have the properties typical of the overlying soil material. The material of a C horizon may be either like or unlike that in which the solum formed. If the material is

known to differ from that in the solum, an Arabic numeral, commonly a 2, precedes the letter C.

Cr horizon.--Soft, consolidated bedrock beneath the soil.

R layer.--Consolidated bedrock beneath the soil.

The bedrock commonly underlies a C horizon, but it can be directly below an A or a B horizon.

Humus. The well decomposed, more or less stable part of the organic matter in mineral soils.

Hydrologic soil groups. Refers to soils grouped according to their runoff potential. The soil properties that influence this potential are those that affect the minimum rate of water infiltration on a bare soil during periods after prolonged wetting when the soil is not frozen. These properties are depth to a seasonal high water table, the infiltration rate and permeability after prolonged wetting, and depth to a very slowly permeable layer. The slope and the kind of plant cover are not considered but are separate factors in predicting runoff.

Igneous rock. Rock formed by solidification from a molten or partially molten state. Major varieties include plutonic and volcanic rock. Examples are andesite, basalt, and granite.

Illuviation. The movement of soil material from one horizon to another in the soil profile. Generally, material is removed from an upper horizon and deposited in a lower horizon.

Impervious soil. A soil through which water, air, or roots penetrate slowly or not at all. No soil is absolutely impervious to air and water all the time.

Increasesers. Species in the climax vegetation that increase in amount as the more desirable plants are reduced by close grazing. Increasesers commonly are the shorter plants and less palatable to livestock.

Infiltration. The downward entry of water into the immediate surface of soil or other material, as contrasted with percolation, which is movement of water through soil layers or material.

Infiltration capacity. The maximum rate at which water can infiltrate into a soil under a given set of conditions.

Infiltration rate. The rate at which water penetrates the surface of the soil at any given instant, usually expressed in inches per hour. The rate can be limited by the infiltration capacity of the soil or the rate at which water is applied at the surface.

Inset fan. A special case of the flood plain of an ephemeral stream that is confined between fan remnants, basin-floor remnants, ballenas, or closely opposed fan toeslopes.

Intake rate. The average rate of water entering the soil under irrigation. Most soils have a fast initial rate;

the rate decreases with application time.

Therefore, intake rate for design purposes is not a constant but is a variable depending on the net irrigation application. The rate of water intake, in inches per hour, is expressed as follows:

Less than 0.2	very low
0.2 to 0.4	low
0.4 to 0.75	moderately low
0.75 to 1.25	moderate
1.25 to 1.75	moderately high
1.75 to 2.5	high
More than 2.5	very high

Intermittent stream. A stream, or reach of a stream, that flows for prolonged periods only when it receives groundwater discharge or long, continued contributions from melting snow or other surface and shallow subsurface sources.

Intermontane basin. A generic term for wide structural depressions between mountain ranges that are partly filled with alluvium. They may be drained internally (bolsons) or externally (semi-bolsons).

Invaders. On range, plants that encroach into an area and grow after the climax vegetation has been reduced by grazing. Generally, plants invade following disturbance of the surface.

Iron depletions. Low-chroma zones having a low content of iron and manganese oxide because of chemical reduction and removal, but having a clay content similar to that of the adjacent matrix. A type of redoximorphic depletion.

Irrigation. Application of water to soils to assist in production of crops. Methods of irrigation are:
Basin.--Water is applied rapidly to nearly level plains surrounded by levees or dikes.
Border.--Water is applied at the upper end of a strip in which the lateral flow of water is controlled by small earth ridges called border dikes or borders.

Controlled flooding.--Water is released at intervals from closely spaced field ditches and distributed uniformly over the field.

Corrugation.--Water is applied to small, closely spaced furrows or ditches in fields of close-growing crops or in orchards so that it flows in only one direction.

Drip (or trickle).--Water is applied slowly and under low pressure to the surface of the soil or into the soil through such applicators as emitters, porous tubing, or perforated pipe.

Furrow.--Water is applied in small ditches made by cultivation implements. Furrows are used for tree and row crops.

Sprinkler.--Water is sprayed over the soil surface through pipes or nozzles from a pressure system.

Subirrigation.--Water is applied in open ditches or tile lines until the water table is raised enough to wet the soil.

Wild flooding.--Water, released at high points, is allowed to flow onto an area without controlled distribution.

Lacustrine deposit. Material deposited in lake water and exposed when the water level is lowered or the elevation of the land is raised.

Lagoon. The nearly level, filled depression behind the longshore bar on a barrier beach.

Lake plain. A surface marking the floor of an extinct lake, filled in by well sorted, stratified sediments.

Lake terrace. The narrow shelf produced along a lake shore and later exposed when the water recedes.

Lamella. A thin, generally horizontal layer of fine material illuviated within a very much thicker, coarser, eluviated layer.

Landform. Any recognizable form or feature on the earth's surface, having a characteristic shape, and produced by natural causes that provide an empirical description of similar portions of the earth's surface.

Landscape. A collection of related, natural landforms.

Landslide. The rapid downhill movement of a mass of soil and loose rock, generally when wet or saturated. The speed and distance of movement, as well as the amount of soil and rock material, vary greatly.

Large stones (in tables). Rock fragments 3 inches (7.6 centimeters) or more across. Large stones adversely affect the specified use of the soil.

Leaching. The removal of soluble material from soil or other material by percolating water.

Liquid limit. The moisture content at which the soil passes from a plastic to a liquid state.

Loam. Soil material that is 7 to 27 percent clay particles, 28 to 50 percent silt particles, and less than 52 percent sand particles.

Loamy soil. Coarse sandy loam, sandy loam, fine sandy loam, very fine sandy loam, loam, silt loam, silt, clay loam, sandy clay loam, or silty clay loam.

Loess. Fine grained material, dominantly of silt-sized particles, deposited by wind.

Longshore bar. A narrow, elongate, coarse-textured ridge, built by the wave action of a pluvial lake, that extends parallel to the shore and separated it from a lagoon; both the bar and lagoon are now relict features.

Low-residue crops. Such crops as corn used for silage, peas, beans, and potatoes. Residue from these crops is not adequate to control erosion until

the next crop in the rotation is established. These crops return little organic matter to the soil.

Low strength. The soil is not strong enough to support loads.

Marl. An earthy, unconsolidated deposit consisting chiefly of calcium carbonate mixed with clay in approximately equal amounts.

Masses. Concentrations of substances in the soil matrix that do not have a clearly defined boundary with the surrounding soil material and cannot be removed as a discrete unit. Common compounds making up masses are calcium carbonate, gypsum or other soluble salts, iron oxide, and manganese oxide. Masses consisting of iron oxide or manganese oxide generally are considered a type of redoximorphic concentration.

Mean annual increment (MAI). The average annual increase in volume of a tree during the entire life of the tree.

Mechanical treatment. Use of mechanical equipment for seeding, brush management, and other management practices.

Medium textured soil. Very fine sandy loam, loam, silt loam, or silt.

Merchantable trees. Trees that are of sufficient size to be economically processed into wood products.

Metamorphic rock. Rock of any origin altered in mineralogical composition, chemical composition, or structure by heat, pressure, and movement. Nearly all such rocks are crystalline.

Mineral soil. Soil that is mainly mineral material and low in organic material. Its bulk density is more than that of organic soil.

Minimum tillage. Only the tillage essential to crop production and prevention of soil damage.

Miscellaneous area. An area that has little or no natural soil and supports little or no vegetation.

Moderately coarse textured soil. Coarse sandy loam, sandy loam, or fine sandy loam.

Moderately deep soil. A soil that is 20 to 40 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Moderately fine textured soil. Clay loam, sandy clay loam, or silty clay loam.

Mollic epipedon. A thick, dark, humus-rich surface horizon (or horizons) that has high base saturation and pedogenic soil structure. It may include the upper part of the subsoil.

Morphology, soil. The physical makeup of the soil, including the texture, structure, porosity, consistence, color, and other physical, mineral, and biological properties of the various horizons, and the thickness and arrangement of those horizons in the soil profile.

Mottling, soil. Irregular spots of different colors that vary in number and size. Descriptive terms are as follows: abundance--*few*, *common*, and *many*; size--*fine*, *medium*, and *coarse*; and contrast--*faint*, *distinct*, and *prominent*. The size measurements are of the diameter along the greatest dimension. *Fine* indicates less than 5 millimeters (about 0.2 inch); *medium*, from 5 to 15 millimeters (about 0.2 to 0.6 inch); and *coarse*, more than 15 millimeters (about 0.6 inch).

Mountain. A natural elevation of the land surface, rising more than 1,000 feet above surrounding lowlands, commonly of restricted summit area (relative to a plateau) and generally having steep sides. A mountain can occur as a single, isolated mass or in a group forming a chain or range.

Muck. Dark, finely divided, well decomposed organic soil material. (See Sapric soil material.)

Mudstone. Sedimentary rock formed by induration of silt and clay in approximately equal amounts.

Munsell notation. A designation of color by degrees of three simple variables--hue, value, and chroma. For example, a notation of 10YR 6/4 is a color with hue of 10YR, value of 6, and chroma of 4.

Natric horizon. A special kind of argillic horizon that contains enough exchangeable sodium to have an adverse effect on the physical condition of the subsoil.

Neutral soil. A soil having a pH value between 6.6 and 7.3. (See Reaction, soil.)

Nodules. Cemented bodies lacking visible internal structure. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up nodules. If formed in place, nodules of iron oxide or manganese oxide are considered types of redoximorphic concentrations.

Nutrient, plant. Any element taken in by a plant essential to its growth. Plant nutrients are mainly nitrogen, phosphorus, potassium, calcium, magnesium, sulfur, iron, manganese, copper, boron, and zinc obtained from the soil and carbon, hydrogen, and oxygen obtained from the air and water.

Observed rooting depth. Depth to which roots have been observed to penetrate.

Organic matter. Plant and animal residue in the soil in various stages of decomposition.

Overstory. The trees in a forest that form the upper crown cover.

Oxbow. The horseshoe-shaped channel of a former meander, remaining after the stream formed a cutoff across a narrow meander neck.

Pan. A compact, dense layer in a soil that impedes the movement of water and the growth of roots. For

example, *hardpan*, *fragipan*, *claypan*, *plowpan*, and *traffic pan*.

Parent material. The unconsolidated organic and mineral material in which soil forms.

Parna dune. An eolian dune built of sand size aggregates of clayey material that commonly occurs leeward of a playa.

Peat. Unconsolidated material, largely undecomposed organic matter, that has accumulated under excess moisture. (See Fibric soil material.)

Ped. An individual natural soil aggregate, such as a granule, a prism, or a block.

Pediment. A gently sloping erosional surface developed at the foot of a receding hill or mountain slope.

Pedisediment. A thin layer of alluvial material that mantles an erosion surface and has been transported to its present position from higher lying areas of the erosion surface.

Pedon. The smallest volume that can be called "a soil." A pedon is three dimensional and large enough to permit study of all horizons. Its area ranges from about 10 to 100 square feet (1 square meter to 10 square meters), depending on the variability of the soil.

Percolation. The downward movement of water through the soil.

Percs slowly (in tables). The slow movement of water through the soil adversely affects the specified use.

Permeability. The quality of the soil that enables water or air to move downward through the profile. The rate at which a saturated soil transmits water is accepted as a measure of this quality. In soil physics, the rate is referred to as "saturated hydraulic conductivity," which is defined in the "Soil Survey Manual." In line with conventional usage in the engineering profession and with traditional usage in published soil surveys, this rate of flow continues to be expressed as "permeability." Terms describing permeability, measured in inches per hour, are as follows:

Extremely slow	0.00 to 0.01 inch
Very slow	0.01 to 0.06 inch
Slow	0.06 to 0.2 inch
Moderately slow	0.2 to 0.6 inch
Moderate	0.6 inch to 2.0 inches
Moderately rapid	2.0 to 6.0 inches
Rapid	6.0 to 20 inches
Very rapid	more than 20 inches

Phase, soil. A subdivision of a soil series based on features that affect its use and management, such as slope, stoniness, and flooding.

- pH value.** A numerical designation of acidity and alkalinity in soil. (See Reaction, soil.)
- Piedmont slope.** The dominant slope at the foot of a mountain. Main components of the piedmont slope include pediments, alluvial fans, fan piedmonts, fan skirts and inset fans.
- Piping** (in tables). Formation of subsurface tunnels or pipelike cavities by water moving through the soil.
- Pitting** (in tables). Pits caused by melting around ice. They form on the soil after plant cover is removed.
- Plasticity index.** The numerical difference between the liquid limit and the plastic limit; the range of moisture content within which the soil remains plastic.
- Plastic limit.** The moisture content at which a soil changes from semisolid to plastic.
- Plateau.** An extensive upland mass with relatively flat summit area that is considerably elevated (more than 100 meters) above adjacent lowlands and separated from them on one or more sides by escarpments.
- Playa.** The generally dry and nearly level lake plain that occupies the lowest parts of closed depressional areas, such as those on intermontane basin floors. Temporary flooding occurs primarily in response to precipitation and runoff.
- Pleistocene.** The epoch of the Quaternary Period of geologic time preceding the Holocene (from approximately 2 million to 10 thousand years ago).
- Plowpan.** A compacted layer formed in the soil directly below the plowed layer.
- Pluvial.** Relating to former periods of abundant rains.
- Ponding.** Standing water on soils in closed depressions. Unless the soils are artificially drained, the water can be removed only by percolation or evapotranspiration.
- Poor filter** (in tables). Because of rapid or very rapid permeability, the soil may not adequately filter effluent from a waste disposal system.
- Poorly graded.** Refers to a coarse grained soil or soil material consisting mainly of particles of nearly the same size. Because there is little difference in size of the particles, density can be increased only slightly by compaction.
- Poor outlets** (in tables). Refers to areas where surface or subsurface drainage outlets are difficult or expensive to install.
- Potential native plant community.** See Climax plant community.
- Potential rooting depth (effective rooting depth).** Depth to which roots could penetrate if the content of moisture in the soil were adequate. The soil has no properties restricting the penetration of roots to this depth.
- Prescribed burning.** Deliberately burning an area for specific management purposes, under the appropriate conditions of weather and soil moisture and at the proper time of day.
- Productivity, soil.** The capability of a soil for producing a specified plant or sequence of plants under specific management.
- Profile, soil.** A vertical section of the soil extending through all its horizons and into the parent material.
- Proper grazing use.** Grazing at an intensity that maintains enough cover to protect the soil and maintain or improve the quantity and quality of the desirable vegetation. This practice increases the vigor and reproduction capacity of the key plants and promotes the accumulation of litter and mulch necessary to conserve soil and water.
- Quartzite, metamorphic.** Rock consisting mainly of quartz that formed through recrystallization of quartz-rich sandstone or chert.
- Quaternary.** The period of geologic time, extending from about 2 million years ago to the present and comprising two epochs, the Pleistocene (Ice Age) and Holocene (Recent).
- Quartzite, sedimentary.** Very hard but unmetamorphosed sandstone consisting chiefly of quartz grains.
- Range condition.** The present composition of the plant community on a range site in relation to the potential natural plant community for that site. Range condition is expressed as excellent, good, fair, or poor on the basis of how much the present plant community has departed from the potential.
- Rangeland.** Land on which the potential natural vegetation is predominantly grasses, grasslike plants, forbs, or shrubs suitable for grazing or browsing. It includes natural grasslands, savannas, many wetlands, some deserts, tundras, and areas that support certain forb and shrub communities.
- Range site.** An area of rangeland where climate, soil, and relief are sufficiently uniform to produce a distinct natural plant community. A range site is the product of all the environmental factors responsible for its development. It is typified by an association of species that differ from those on other range sites in kind or proportion of species or total production.
- Reaction, soil.** A measure of acidity or alkalinity of a soil, expressed in pH values. A soil that tests to pH 7.0 is described as precisely neutral in reaction because it is neither acid nor alkaline. The degrees of acidity or alkalinity, expressed as pH values, are:

Ultra acid	less than 3.5
Extremely acid	3.5 to 4.4
Very strongly acid	4.5 to 5.0
Strongly acid	5.1 to 5.5
Moderately acid	5.6 to 6.0
Slightly acid	6.1 to 6.5
Neutral	6.6 to 7.3
Slightly alkaline..... (mildly alkaline)	7.4 to 7.8
Moderately alkaline.....	7.9 to 8.4
Strongly alkaline	8.5 to 9.0
Very strongly alkaline.....	9.1 and higher

Redoximorphic concentrations. Nodules, concretions, soft masses, pore linings, and other features resulting from the accumulation of iron or manganese oxide. An indication of chemical reduction and oxidation resulting from saturation.

Redoximorphic depletions. Low-chroma zones from which iron and manganese oxide or a combination of iron and manganese oxide and clay has been removed. These zones are indications of the chemical reduction of iron resulting from saturation.

Redoximorphic features. Redoximorphic concentrations, redoximorphic depletions, reduced matrices, a positive reaction to alpha,alpha-dipyridyl, and other features indicating the chemical reduction and oxidation of iron and manganese compounds resulting from saturation.

Reduced matrix. A soil matrix that has low chroma in situ because of chemically reduced iron (Fe II). The chemical reduction results from nearly continuous wetness. The matrix undergoes a change in hue or chroma within 30 minutes after exposure to air as the iron is oxidized (Fe III). A type of redoximorphic feature.

Regeneration. The new growth of a natural plant community, developing from seed.

Regolith. The unconsolidated mantle of weathered rock and soil material on the earth's surface; the loose earth material above the solid rock.

Relict stream terrace. One of a series of platforms in or adjacent to a stream valley that formed prior to the current stream system.

Relief. The elevations or inequalities of a land surface, considered collectively.

Residuum (residual soil material). Unconsolidated, weathered or partly weathered mineral material that accumulated as consolidated rock disintegrated in place.

Rill. A steep-sided channel resulting from accelerated erosion. A rill is generally a few inches deep and not wide enough to be an obstacle to farm machinery.

Riverwash. Unstable areas of sandy, silty, clayey, or gravelly sediments. These areas are flooded,

washed, and reworked by rivers so frequently that they support little or no vegetation.

Road cut. A sloping surface produced by mechanical means during road construction. It is commonly on the uphill side of the road.

Rock fragments. Rock or mineral fragments having a diameter of 2 millimeters or more; for example, pebbles, cobbles, stones, and boulders.

Rock outcrop. Exposures of bare bedrock other than lava flows and rock-lined pits.

Rooting depth (in tables). Shallow root zone. The soil is shallow over a layer that greatly restricts roots.

Root zone. The part of the soil that can be penetrated by plant roots.

Rubble land. Areas that have more than 90 percent of the surface covered by stones or boulders. Voids contain no soil material and virtually no vegetation other than lichens. The areas commonly are at the base of mountain slopes, but some are on mountain slopes as deposits of cobbles, stones, and boulders left by Pleistocene glaciation or by periglacial phenomena.

Runoff. The precipitation discharged into stream channels from an area. The water that flows off the surface of the land without sinking into the soil is called surface runoff. Water that enters the soil before reaching surface streams is called groundwater runoff or seepage flow from ground water.

Saline soil. A soil containing soluble salts in an amount that impairs the growth of plants. A saline soil does not contain excess exchangeable sodium.

Salinity. The electrical conductivity of a saline soil. It is expressed, in millimhos per centimeter, as follows:

Nonsaline	0 to 2
Very slightly saline	2 to 4
Slightly saline	4 to 8
Moderately saline	8 to 16
Strongly saline	More than 16

Salty water (in tables). Water that is too salty for consumption by livestock.

Sand. As a soil separate, individual rock or mineral fragments from 0.05 millimeter to 2.0 millimeters in diameter. Most sand grains consist of quartz. As a soil textural class, a soil that is 85 percent or more sand and not more than 10 percent clay.

Sand sheet. A large, irregularly shaped, surficial mantle of eolian sand.

Sandstone. Sedimentary rock containing dominantly sand-sized particles.

Sandy soil. Sand or loamy sand.

Sapric soil material (muck). The most highly decomposed of all organic soil material. Muck has

the least amount of plant fiber, the highest bulk density, and the lowest water content at saturation of all organic soil material.

Saprolite. Unconsolidated residual material underlying the soil and grading to hard bedrock below.

Saturation. Wetness characterized by zero or positive pressure of the soil water. Under conditions of saturation, the water will flow from the soil matrix into an unlined auger hole.

Sawlogs. Logs of suitable size and quality for the production of lumber.

Scarification. The act of abrading, scratching, loosening, crushing, or modifying the surface to increase water absorption or to provide a more tillable soil.

Scribner's log rule. A method of estimating the number of board feet that can be cut from a log of a given diameter and length.

Second bottom. The first terrace above the normal flood plain (or first bottom) of a river.

Sedimentary rock. Rock made up of particles deposited from suspension in water. The chief kinds of sedimentary rock are conglomerate, formed from gravel; sandstone, formed from sand; shale, formed from clay; and limestone, formed from soft masses of calcium carbonate. There are many intermediate types. Some wind-deposited sand is consolidated into sandstone.

Seepage (in tables). The movement of water through the soil. Seepage adversely affects the specified use.

Semi-bolson. An intermontane basin that is drained externally by an intermittent stream.

Sequum. A sequence consisting of an illuvial horizon and the overlying eluvial horizon. (See Eluviation.)

Series, soil. A group of soils that have profiles that are almost alike, except for differences in texture of the surface layer. All the soils of a series have horizons that are similar in composition, thickness, and arrangement.

Shale. Sedimentary rock formed by the hardening of a clay deposit.

Shallow soil. A soil that is 10 to 20 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Sheet erosion. The removal of a fairly uniform layer of soil material from the land surface by the action of rainfall and surface runoff.

Shelterwood system. A forest management system requiring the removal of a stand in a series of cuts so that regeneration occurs under a partial canopy. After regeneration, a final cut removes the shelterwood and allows the stand to develop in the open as an even-aged stand. The system is well

suited to sites where shelter is needed for regeneration, and it can aid regeneration of the more intolerant tree species in a stand.

Shoulder slope. The uppermost inclined surface at the top of a hillside. It is the transition zone from the back slope to the summit of a hill or mountain. The surface is dominantly convex in profile and erosional in origin.

Shrink-swell (in tables). The shrinking of soil when dry and the swelling when wet. Shrinking and swelling can damage roads, dams, building foundations, and other structures. It can also damage plant roots.

Shrub-coppice dune. A small dune that forms around shrubs or small trees.

Silica. A combination of silicon and oxygen. The mineral form is called quartz.

Silt. As a soil separate, individual mineral particles that range in diameter from the upper limit of clay (0.002 millimeter) to the lower limit of very fine sand (0.05 millimeter). As a soil textural class, soil that is 80 percent or more silt and less than 12 percent clay.

Siltstone. Sedimentary rock made up of dominantly silt-sized particles.

Similar soils. Soils that share limits of diagnostic criteria, behave and perform in a similar manner, and have similar conservation needs or management requirements for the major land uses in the survey area.

Sinkhole. A depression in the landscape where limestone has been dissolved.

Site class. A grouping of site indexes into five to seven production capability levels. Each level can be represented by a site curve.

Site curve (50-year). A set of related curves on a graph that shows the average height of dominant or dominant and codominant trees for the range of ages on soils that differ in productivity. Each level is represented by a curve. The basis of the curves is the height of dominant or dominant and codominant trees that are 50 years old or are 50 years old at breast height.

Site curve (100-year). A set of related curves on a graph that shows the average height of dominant or dominant and codominant trees for a range of ages on soils that differ in productivity. Each level is represented by a curve. The basis of the curves is the height of dominant or dominant and codominant trees that are 100 years old or are 100 years old at breast height.

Site index. A designation of the quality of a forest site based on the height of the dominant stand at an arbitrarily chosen age. For example, if the average

height attained by dominant and codominant trees in a fully stocked stand at the age of 50 years is 75 feet, the site index is 75.

Skid trails. Pathways along which logs are dragged to a common site for loading onto a logging truck.

Slash. The branches, bark, treetops, reject logs, and broken or uprooted trees left on the ground after logging.

Slickens. Accumulations of fine-textured material, such as material separated in placer-mine and ore-mill operations. Slickens from ore mills commonly consist of freshly ground rock that has undergone chemical treatment during the milling process.

Slickensides. Polished and grooved surfaces produced by one mass sliding past another. In soils, slickensides may occur at the bases of slip surfaces on the steeper slopes; on faces of blocks, prisms, and columns; and in swelling clayey soils, where there is marked change in moisture content.

Slick spot. A small area of soil having a puddled, crusted, or smooth surface and an excess of exchangeable sodium. The soil generally is silty or clayey, is slippery when wet, and is low in productivity.

Slippage (in tables). Soil mass susceptible to movement downslope when loaded, excavated, or wet.

Slope. The inclination of the land surface from the horizontal. Percentage of slope is the vertical distance divided by horizontal distance, then multiplied by 100. Thus, a slope of 20 percent is a drop of 20 feet in 100 feet of horizontal distance. In this survey, the following slope classes are recognized:

Nearly level.....	0 to 2 percent
Gently sloping	2 to 4 percent
Moderately sloping.....	4 to 8 percent
Strongly sloping	8 to 15 percent
Moderately steep	15 to 30 percent
Steep.....	30 to 50 percent
Very steep	50 to 75 percent
Extremely steep.....	75 percent and higher

Slope (in tables). Slope is great enough that special practices are required to ensure satisfactory performance of the soil for a specific use.

Slow intake (in tables). The slow movement of water into the soil.

Slow refill (in tables). The slow filling of ponds, resulting from restricted permeability in the soil.

Small stones (in tables). Rock fragments less than 3 inches (7.6 centimeters) in diameter. Small stones adversely affect the specified use of the soil.

Sodic (alkali) soil. A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

Sodicity. The degree to which a soil is affected by exchangeable sodium. Sodicity is expressed as a sodium adsorption ratio (SAR) of a saturation extract, or the ratio of Na^+ to $Ca^{++} + Mg^{++}$. The degrees of sodicity and their respective ratios are:

Very slight.....	5-12:1
Slight	13-30:1
Moderate	31-45:1
Strong	46-90:1
Very strong	more than 90:1

Soft bedrock. Bedrock that can be excavated with trenching machines, backhoes, small rippers, and other equipment commonly used in construction.

Soil. A natural, three-dimensional body at the earth's surface. It is capable of supporting plants and has properties resulting from the integrated effect of climate and living matter acting on earthy parent material, as conditioned by relief over periods of time.

Soil separates. Mineral particles less than 2 millimeters in equivalent diameter and ranging between specified size limits. The names and sizes, in millimeters, of separates recognized in the United States are as follows:

Very coarse sand.....	2.0 to 1.0
Coarse sand	1.0 to 0.5
Medium sand	0.5 to 0.25
Fine sand.....	0.25 to 0.10
Very fine sand.....	0.10 to 0.05
Silt	0.05 to 0.002
Clay	less than 0.002

Solum. The upper part of a soil profile, above the C horizon, in which the processes of soil formation are active. The solum in soil consists of the A, E, and B horizons. Generally, the characteristics of the material in these horizons are unlike those of the material below the solum. The living roots and plant and animal activities are largely confined to the solum.

Species. A single, distinct kind of plant or animal having certain distinguishing characteristics.

Stone line. A concentration of coarse fragments in a soil. Generally, it is indicative of an old weathered surface. In a cross section, the line may be one fragment or more thick. It generally overlies material that weathered in place and is overlain by recent sediment of variable thickness.

- Stones.** Rock fragments 10 to 24 inches (25 to 60 centimeters) in diameter if rounded or 15 to 24 inches (38 to 60 centimeters) in length if flat.
- Stony.** Refers to a soil containing stones in numbers that interfere with or prevent tillage.
- Strath terrace.** A surface cut formed by the erosion of hard or semiconsolidated bedrock and thinly mantled with stream deposits.
- Stream channel.** The hollow bed where a natural stream of surface water flows or may flow; the deepest or central part of the bed, formed by the main current and covered more or less continuously by water.
- Stream terrace.** One of a series of platforms in a stream valley, flanking and more or less parallel to the stream channel. It originally formed near the level of the stream and is the dissected remnants of an abandoned flood plain, streambed, or valley floor that were produced during a former stage of erosion or deposition.
- Stripcropping.** Growing crops in a systematic arrangement of strips or bands that provide vegetative barriers to soil blowing and water erosion.
- Structure, soil.** The arrangement of primary soil particles into compound particles or aggregates. The principal forms of soil structure are: *platy* (laminated), *prismatic* (vertical axis of aggregates longer than horizontal), *columnar* (prisms with rounded tops), *blocky* (angular or subangular), and *granular*. *Structureless* soils are either *single grain* (each grain by itself, as in dune sand) or *massive* (the particles adhering without any regular cleavage, as in many hardpans).
- Stubble mulch.** Stubble or other crop residue left on the soil or partly worked into the soil. It protects the soil from wind and water erosion after harvest, during preparation of a seedbed for the next crop, and during the early growing period of the new crop.
- Subsoil.** Technically, the B horizon, roughly, the part of the solum below plow depth.
- Subsoiling.** Tilling a soil below normal plow depth, ordinarily to shatter a hardpan or claypan.
- Substratum.** The part of the soil below the solum.
- Subsurface layer.** Any surface soil horizon (A, E, AB, or EB) below the surface layer.
- Summer fallow.** The tillage of uncropped land during the summer to control weeds and allow storage of moisture in the soil for the growth of a later crop. A practice common in semiarid regions, where annual precipitation is not enough to produce a crop every year. Summer fallow is frequently practiced before planting winter grain.
- Summit.** A general term for the top, or highest level, of an upland feature, such as a hill or mountain. It commonly refers to a higher area that has a gentle slope and is flanked by steeper slopes.
- Surface layer.** The soil ordinarily moved in tillage, or its equivalent in uncultivated soil, ranging in depth from 4 to 10 inches (10 to 25 centimeters). Frequently designated as the "plow layer" or the "Ap horizon."
- Surface soil.** The A, E, AB, and EB horizons, considered collectively. It includes all subdivisions of these horizons.
- Tailwater.** The water directly downstream of a structure.
- Talus.** Fragments of rock and other soil material accumulated by gravity at the foot of cliffs or steep slopes.
- Taxadjuncts.** Soils that cannot be classified in a series recognized in the classification system. Such soils are named for a series they strongly resemble and are designated as taxadjuncts to that series because they differ in ways too small to be of consequence in interpreting their use and behavior. Soils are recognized as taxadjuncts only when one or more of their characteristics are slightly outside the range defined for the family of the series for which the soils are named.
- Terrace.** An embankment, or ridge, constructed across sloping soils on the contour or at a slight angle to the contour. The terrace intercepts surface runoff so that water soaks into the soil or flows slowly to a prepared outlet. A terrace in a field is generally built so that the field can be farmed. A terrace intended mainly for drainage has a deep channel that is maintained in permanent sod.
- Terrace (geologic).** A step-like surface, ordinarily flat or undulating, bordering a river, a lake, or the sea representing a former flood plain.
- Texture, soil.** The relative proportions of sand, silt, and clay particles in a mass of soil. The basic textural classes, in order of increasing proportion of fine particles, are *sand*, *loamy sand*, *sandy loam*, *loam*, *silt loam*, *silt*, *sandy clay loam*, *clay loam*, *silty clay loam*, *sandy clay*, *silty clay*, and *clay*. The sand, loamy sand, and sandy loam classes may be further divided by specifying "coarse," "fine," or "very fine."
- Thin layer (in tables).** Otherwise suitable soil material too thin for the specified use.
- Till plain.** An extensive area of nearly level to undulating soils underlain by glacial till.
- Tilth, soil.** The physical condition of the soil as related to tillage, seedbed preparation, seedling emergence, and root penetration.

Toe slope. The outermost inclined surface at the base of a hill; part of a foot slope.

Too arid (in tables). The soil is dry most of the time, and vegetation is difficult to establish.

Topsoil. The upper part of the soil, which is the most favorable material for plant growth. It is ordinarily rich in organic matter and is used to topdress roadbanks, lawns, and land affected by mining.

Toxicity (in tables). Excessive amount of toxic substances, such as sodium or sulfur, that severely hinder establishment of vegetation or severely restrict plant growth.

Trace elements. Chemical elements, for example, zinc, cobalt, manganese, copper, and iron, in soils in extremely small amounts. They are essential to plant growth.

Trafficability. The degree to which a soil is capable of supporting vehicular traffic across a wide range in soil moisture conditions.

Tread. The relatively flat terrace surface that was cut or built by stream or wave action.

Tuff. A compacted deposit that is 50 percent or more volcanic ash and dust.

Understory. Any plants in a forest community that grow to a height of less than 5 feet.

Unstable fill (in tables). Risk of caving or sloughing on banks of fill material.

Upland (geology). Land at a higher elevation, in general, than the alluvial plain or stream terrace; land above the lowlands along streams.

Valley. An elongated depressional area primarily developed by stream action.

Valley fill. In glaciated regions, material deposited in stream valleys by glacial meltwater. In nonglaciated regions, alluvium deposited by heavily loaded streams.

Variation. Refers to patterns of contrasting colors assumed to be inherited from the parent material rather than to be the result of poor drainage.

Very deep soil. A soil that is more than 60 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Very shallow soil. A soil that is less than 10 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Water bars. Smooth, shallow ditches or depressional areas that are excavated at an angle across a sloping road. They are used to reduce the downward velocity of water and divert it off and away from the road surface. Water bars can easily be driven over if constructed properly.

Waterspreading. Diverting runoff from natural channels by means of a system of dams, dikes, or ditches and spreading it over relatively flat surfaces.

Water supplying capacity. The total amount of water available in the soil for plant growth in a normal year from precipitation and from runoff from higher areas. Runoff and water lost to deep percolation are not included.

Weathering. All physical and chemical changes produced in rocks or other deposits at or near the earth's surface by atmospheric agents. These changes result in disintegration and decomposition of the material.

Well graded. Refers to soil material consisting of coarse grained particles that are well distributed over a wide range in size or diameter. Such soil normally can be easily increased in density and bearing properties by compaction. Contrasts with poorly graded soil.

Wilting point (or permanent wilting point). The moisture content of soil, on an oven-dry basis, at which a plant (specifically, a sunflower) wilts so much that it does not recover when placed in a humid, dark chamber.

Windthrow. The uprooting and tipping over of trees by the wind.

Soil Survey of Elko County, Nevada, Northeast Part

This soil survey is an inventory and evaluation of the soils in the survey area. It can be used to adjust land uses to the limitations and potentials of natural resources and the environment. Also, it can help to prevent soil-related failures in land uses.

In preparing a soil survey, soil scientists, conservationists, engineers, and others collect extensive field data about the nature and behavioral characteristics of the soils. They collect data on erosion, droughtiness, flooding, and other factors that affect various soil uses and management. Field experience and collected data on soil properties and performance are used as a basis in predicting soil behavior.

Information in this section can be used to plan the use and management of soils for crops and pasture; as rangeland and woodland; as sites for buildings, sanitary facilities, highways and other transportation systems, and parks and other recreational facilities; and for wildlife habitat. It can be used to identify the potentials and limitations of each soil for specific land uses and to help prevent construction failures caused by unfavorable soil properties.

Interpretative ratings help engineers, planners, and others to understand how soil properties influence important nonagricultural uses, such as building site development and construction materials. The ratings indicate the most restrictive soil features affecting the suitability of the soils for these uses.

Soils are rated in their natural state. No unusual modification of the soil site or material is made other than that which is considered normal practice for the rated use. Even though soils may have limitations, it is important to remember that engineers and others can modify soil features or can design or adjust the plans for a structure to compensate for most of the limitations. Many of these practices, however, are costly. The final decision in selecting a site for a particular use generally involves weighing the costs of site preparation and maintenance.

Planners and others using soil survey information can evaluate the effect of specific uses on productivity and on the environment in all or part of the survey area. The survey can help planners to maintain or create a land use pattern in harmony with the natural soil.

Contractors can use this survey to locate sources of sand and gravel, roadfill, and topsoil. They can use it to identify areas where bedrock, wetness, or very firm soil layers can cause difficulty in excavation.

Health officials, highway officials, engineers, and others may also find this survey useful. The survey can help them plan the safe disposal of wastes and locate sites for pavements, sidewalks, campgrounds, playgrounds, lawns, trees, and shrubs.

Crops and Pasture

General management needed for crops and pasture is suggested in this section. The system of land capability classification used by the Natural Resources Conservation Service is explained. The estimated yields of the main crops and pasture plants are listed for each soil in table 5 at the back of this publication.

Planners of management systems for individual fields or farms should consider the detailed information given in the description of each soil under the heading "Detailed Soil Map Units" in Part I of this Publication and in the "Soil Properties" portion of Part II. Specific information can be obtained from the local office of the Natural Resources Conservation Service or Cooperative Extension.

Crop Yield Estimates

The average yields per acre that can be expected of the principal irrigated crops under a high level of management are shown in table 5, "Land Capability and Yields per Acre of Crops." In any given year, yields may be higher or lower than those indicated in the table because of variations in rainfall and other climatic factors. The land capability classification of each map unit also is shown in the table.

The yields are based mainly on the experience and records of farmers, conservationists, and extension agents. Available yield data from nearby counties and results of field trials and demonstrations are also considered.

For yields of irrigated crops, it is assumed that the irrigation system is adapted to the soils and to the crops grown, that good-quality irrigation water is uniformly applied as needed, and that tillage is kept to a minimum.

The management needed to obtain the indicated yields of the various crops depends on the kind of soil and the crop. Management can include drainage, erosion control, and protection from flooding; the

proper planting and seeding rates; suitable high-yielding crop varieties; appropriate and timely tillage; control of weeds, plant diseases, and harmful insects; favorable soil reaction and optimum levels of nitrogen, phosphorus, potassium, and trace elements for each crop; effective use of crop residue, barnyard manure, and green manure crops; and harvesting that ensures the smallest possible loss.

The estimated yields reflect the productive capacity of each soil for each of the principal crops. Yields are likely to increase as new production technology is developed. The productivity of a given soil compared with that of other soils, however, is not likely to change.

Crops other than those shown in the table are grown in the survey area, but estimated yields are not listed because the acreage of such crops is small. The local office of the Natural Resources Conservation Service or Cooperative Extension can provide information about the management and productivity of the soils for those crops.

Pasture and Hayland Interpretations

Under good management, proper grazing is essential for the production of high quality forage, stand survival, and erosion control. Proper grazing helps plants to maintain sufficient and generally vigorous top growth during the growing season. Brush control is essential in many areas, and weed control generally is needed. Rotation grazing and renovation also are important management practices.

Yield estimates are often provided in animal unit months (AUM), the amount of forage or feed required to feed one animal unit (one cow, one horse, one mule, five sheep, or five goats) for 30 days.

Information about forage yields other than those shown in table 5, "Land Capability and Yields per

Acre of Crops" can be provided by the local office of the Natural Resources Conservation Service or Cooperative Extension.

Land Capability Classification

Land capability classification shows, in a general way, the suitability of soils for most kinds of field crops. Crops that require special management are excluded. The soils are grouped according to their limitations for field crops, the risk of damage if they are used for crops, and the way they respond to management. The criteria used in grouping the soils do not include major and generally expensive landforming that would change slope, depth, or other characteristics of the soils, nor do they include possible but unlikely major reclamation projects. Capability classification is not a substitute for interpretations designed to show suitability and limitations of groups of soils for rangeland, for woodland, or for engineering purposes.

In the capability system, as described in "Land Capability Classification" (19), soils generally are grouped at three levels: capability class, subclass, and unit. These levels indicate the degree and kinds of limitations affecting mechanized farming systems that produce the more commonly grown field crops, such as corn, small grain, cotton, hay, and field-grown vegetables. Only class and subclass are used in this survey.

Capability classes, the broadest groups, are designated by Roman numerals I through VIII. The numerals indicate progressively greater limitations and narrower choices for practical use.

If properly managed, soils in classes I, II, III, and IV are suitable for the mechanized production of commonly grown field crops and for pasture and woodland. The degree of the soil limitations affecting the production of cultivated crops increases progressively from class I to class IV. The limitations can affect levels of production and the risk of permanent soil deterioration caused by erosion and other factors.

Soils in classes V, VI, and VII are generally not suited to the mechanized production of commonly grown field crops without special management, but they are suitable for plants that provide a permanent cover, such as grasses and trees. The severity of the soil limitations affecting crops increases progressively from class V to class VII. The local office of the Cooperative Extension or Natural Resources Conservation Service can provide

guidance on the use of these soils as cropland.

Areas in class VIII are generally not suitable for crops, pasture, or woodland without a level of management that is impractical. These areas may have potential for other uses, such as recreational facilities and wildlife habitat.

Capability subclasses indicate the dominant limitations in the class. They are designated by adding a small letter, *e*, *w*, *s*, or *c*, to the class numeral, for example, IIe. The letter *e* shows that the main hazard is the risk of erosion unless a close-growing plant cover is maintained; *w* shows that water in or on the soil interferes with plant growth or cultivation (in some soils the wetness can be partly corrected by artificial drainage); *s* shows that the soil is limited mainly because it is shallow, droughty, or stony; and *c* shows that the chief limitation is a climate that is very cold or very dry.

There are no subclasses in class I because the soils of this class have few limitations. Class V contains only the subclasses indicated by *w*, *s*, or *c* because the soils in class V are subject to little or no erosion. They have other limitations that restrict their use mainly to pasture, rangeland, woodland, wildlife habitat, or recreation.

The irrigated capability classification of each farmland map unit is given in table 5, "Land Capability and Yields per Acre of Crops."

Erosion Factors

Soil erodibility factors *K_w* and *K_f* quantify the susceptibility of soil to detachment by water. A wind erodibility group (WEG) is a grouping of soils that have similar properties affecting their resistance to soil blowing. The Wind Erodibility Index (*I*) is based on the WEG and is used in the wind erosion equation. Soil erodibility factors *K_w* and *K_f* are used in the Revised Universal Soil Loss Equation. The procedure for predicting soil loss is useful in guiding the selection of soil and water conservation practices.

Soil Erodibility Factors *K_w* and *K_f*

Factor *K_w* shows the erodibility of the whole soil, and factor *K_f* shows the erodibility of only the fine-earth fraction, the material less than 2.0 millimeters in diameter. The soil erodibility factor indicates the susceptibility of a soil to sheet and rill erosion by water. The soil properties that influence erodibility

are those that affect the infiltration rate, the movement of water through the soil, and the water storage capacity of the soil and those that allow the soil to resist dispersion, splashing, abrasion, and the transporting forces of rainfall and runoff. The most important soil properties are the content of silt plus very fine sand, the content of sand coarser than very fine sand, the content of organic matter, soil structure, and permeability.

Wind Erodibility Groups

Soils are assigned wind erodibility groups on the basis of the properties of the surface layer. The properties that are most important with respect to soil blowing are soil texture, content of organic matter, calcium carbonate, reaction, content of rock fragments, and aggregate stability. Wind erodibility is inversely related to the percentage of dry surface soil aggregates larger than 0.84 millimeter in diameter. From this percentage, the wind erodibility index factor (I) is determined.

Soil Loss Tolerance (T) Factor

The annual Soil Loss Tolerance (T) is an estimate of the maximum rate of erosion that can occur without affecting crop productivity. The T factor is expressed in tons of soil loss per acre per year. Values of 1 to 5 are used. T values are assigned according to properties of limiting subsurface soil layers. The designation of a limiting layer implies that the material above the layer has more favorable properties for crop production. The criteria for assigning T are based on the severity of physical or chemical properties of subsurface layers, the climatically influenced properties of soil moisture and temperature, the economic feasibility of utilizing management practices to overcome limiting layers or conditions, and the depth to the limiting layer.

Additional information about wind erodibility groups and I, Kw, Kf, and T factors can be obtained from local offices of the Natural Resources Conservation Service or Cooperative Extension.

Rangeland And Grazeable Woodland Resource Management

In this soil survey report, the term "rangeland" refers to a kind of land rather than a land use. Areas of rangeland provide many important resource values. They act as vast watersheds and provide habitat for wildlife, livestock forage, and opportunities for recreation. The resource values of rangeland are intricately related to each other and are often directly affected by rangeland management. Because of the interrelationships among rangeland resources, rangeland managers should consider all resource values when planning range improvements.

About 90 percent of the acreage in this survey area is rangeland. Livestock grazing is the principal agricultural use of the rangeland. Livestock operations are mostly cow-calf or cow-calf-sheep enterprises. Ranches range from a few hundred to several thousands acres in size. They rely heavily on permitted use of public lands. Most of the rangeland within the survey area is administered by the Bureau of Land Management. The Bureau of Indian Affairs has management responsibility for the rangeland within Indian reservations.

Soil-Site Correlation

During the course of this soil survey, ecological sites were correlated with the soils identified within the survey area. These correlations are based on the current understanding of soil-plant-climate relationships in the survey area. Soil properties that affect moisture supply and plant nutrients have the greatest influence on the productivity of range plants. Soil reaction, content of salts or lime, and topographic position are also important. The relationship of climate to vegetation and soils is considered in the classification of soils and in soil mapping criteria. In areas that have similar climate and topography, differences in the kind and amount of vegetation produced on rangeland are closely related to the kind of soil. Ecological sites can generally be determined from soil maps and map unit legends developed for the survey area.

Range Condition

Mining is the major industrial use of rangeland in the survey area and has played an important role in the history of the area. During the mining booms of the 1870's, herds of cattle, sheep, oxen, horses, and burros were brought to Elko County Northeast to be used as a source of power and feed for the developing mining communities. Heavy grazing pressure during these boom periods depleted native stands of forage throughout much of the survey area.

The early devastation of rangeland plant communities through uncontrolled livestock grazing ended long ago, but severely depleted areas still reflect the abuses of early settlement. In the most severely disturbed areas, palatable shrubs generally have been replaced by less desirable shrubs and many native perennial grasses and forbs have been replaced by alien or introduced annual grasses and forbs. Recovery of the plant community has been most evident where previous abuses were limited. The greater the level of deterioration, the longer the period of recovery. Although present-day rangeland production and plant diversity in the survey area are generally less than optimal, the overall condition of the rangeland is much improved from what was common in the early 1900's.

Range condition is determined by a comparison of the present plant community with the natural potential plant community on a particular rangeland ecological site. The more closely the existing community resembles the potential plant community, the higher the range condition. Range condition is an ecological rating only. It does not have a specific meaning that pertains to the present plant community for a given use. Ratings of range condition alone do not indicate whether the present plant community is improving or deteriorating in relation to its potential. The trend in range condition is a measure of the direction of change in the condition. It is an expression of the effects of

current use. The present range condition is a reflection of the accumulated effects of past use. Once the potential plant communities have been identified and the present range condition has been determined, monitoring the trend in range condition over time can indicate whether management objectives are being met.

Rangeland Management

Range management requires a knowledge of the kinds of soil and of the natural potential plant communities the soils in a given area can support. It also requires an evaluation of the present range condition. For most rangeland plant communities, good management can improve the present condition and productivity of the range and can help to prevent accelerated erosion. Proper management of rangeland depends on many factors. The season of grazing use, the kind of grazing animal, the intensity and distribution of grazing, and the range resource potential are important management considerations. Multiple-use management that meets present and future needs requires extensive knowledge of the capabilities and limitations of the range resources. An understanding of the soil properties and dynamics of native plant communities is fundamental in applying ecological principles to the evaluation and management of rangeland.

Generally, the objective of range management is to manage grazing so that the plants growing on a site are about the same in kind and amount as the natural potential plant community for that site. Such management generally results in the optimum production of vegetation, conservation of water, and control of erosion. To meet a special need or a specific use, however, it may be desirable to manage for a plant community other than the potential plant community for the site. Care must always be taken not to increase the susceptibility to erosion. Future uses and the relative ability of given sites to respond to management should be considered if the management objective is to establish a plant community other than the potential plant community.

Desirable forage plants of many plant communities within the survey area have been greatly depleted or even eliminated by excessive and untimely grazing. Generally, perennial grasses have decreased in abundance and woody plants have increased. The productivity of forage plants is below the production potential on many sites. Uneven livestock

distribution has resulted in both overuse and underuse of the native forage.

An increase in the abundance and size of shrubs and an extensive invasion of cheatgrass (an introduced annual grass) have reduced the amount of soil moisture and nutrients available to perennial grasses and forbs. In areas where the range condition has not excessively deteriorated and an adequate population of desirable perennial grasses and forbs is available to respond to a release from plant competition, brush management can be effective in reversing the trend toward an increasing dominance of woody vegetation.

Abusive grazing of riparian vegetation by livestock can reduce water quality, eliminate streamside shrubs, cause soil compaction, accelerate erosion, and break down streambanks. Proper management of the rangeland in the survey area requires that special attention be given to riparian zones. Fortunately, riparian communities often respond to improved livestock management more rapidly than upland plant communities. Grazing treatments in riparian areas vary with the stability of the riparian plant community and the condition of the adjacent upland plant communities.

Rangeland Seeding

Rangeland seeding may be required following the removal of woody vegetation in areas where desirable understory plants are scarce or are not included in the present plant community. Revegetation also may be necessary for critical area treatment following a wildfire or other major disturbance. Maximum grazing capacity can be achieved in seeded stands where the objective of management is uniform grazing of the stands and prevention of the concentration of livestock. Additional water developments and fencing may be required to meet management objectives.

The success of range seeding depends on the amount of moisture available during the growing season. Even in areas where adapted species are planted and improved seeding and land treatment techniques are applied, the success of range seeding is strongly influenced by rainfall. The distribution and amount of precipitation in the survey area fluctuate widely from one year to the next. Years of below normal precipitation are relatively frequent, and the risk of seeding failure caused by the unpredictability of climate should be acknowledged in addition to critical soil properties that affect seeding success.

Each soil in the survey area is rated in table 6, "Suitability for Rangeland Seeding." The criteria used in the development of these ratings are available from the local Nevada office of the Natural Resources Conservation Service. Where critical area treatment is necessary, providing a plant cover that helps to prevent accelerated erosion may be advantageous on soils that are poorly suited to range seeding. The plants that are suited to the soils in the area to be treated should be selected for seeding.

More specific management concerns are addressed under the heading "Plant Communities of Elko County, Nevada Northeast " later in this section. Additional information about rangeland management can be obtained from local offices of the Natural Resources Conservation Service or Cooperative Extension.

Wildlife Considerations

Reducing the extent of brush cover can benefit many game and nongame wildlife species where the habitat needs of those animals are properly identified and planned for in the manipulation of vegetation. For instance, extensive areas dominated by big sagebrush provide marginal habitat for pronghorn antelope. The habitat can be improved by measures that decrease the density and height of the sagebrush. The habitat for mule deer can be improved by removing big sagebrush and thus enhancing the diversity of understory grasses and forbs or increasing the production of green forage on transitional range that has an excessive cover of shrubs.

For other species, however, brush removal may be detrimental. Sage grouse is a habitat-specific bird, relying primarily on sagebrush to meet its life requirements. Plans for the manipulation of sagebrush stands on range inhabited by sage grouse should provide for the maintenance of suitable grouse habitat, especially nesting habitat near strutting grounds. The optimum nesting habitat for sage grouse is one in which the crown cover of sagebrush that is less than 30 inches high is 20 to 40 percent. Treatment of the sagebrush that reduces the cover from 40 to 20 percent may not seriously degrade the nesting habitat and commonly improves the quality of forage for sage grouse.

In an assessment of how the manipulation of vegetation affects wildlife, "edge" habitat is an important consideration. The structure and dominance of plants that remain after manipulation differ with the method of treatment. Fire removes all

of the vegetation, including the skeletons or woody portions of shrubs, and thus eliminates the structure of woody vegetation from the treated area. Prescribed burning may enhance the habitat for a number of wildlife species. Mule deer and many nongame species select recently burned areas for feeding. Brush treatment with herbicides leaves the dead skeletons of shrubs and retains the shrub structure. Herbicides may kill broad-leaved forbs in the shrub understory, which are staples in the diet of many game and nongame species. Chaining and, to a lesser degree, brush beating change the vegetative structure from tree/shrub or shrub to grassland, and the residue they leave on the ground creates habitat for small mammals.

Many wildlife species in the survey area depend on riparian plant communities during much of the year. These plant communities support wildlife not common to desert ecosystems, such as short-eared owls, Pacific tree frogs, and long-tailed weasels. Riparian communities also provide islands of habitat in desert environments for migrating birds. Nuthatches, warblers, and other species that nest in forest ecosystems migrate to desert riparian zones in spring and fall.

Livestock water developments can be beneficial to wildlife if the water is available when the wildlife species occupy the area. Forage for wildlife can be enhanced if adapted forbs are included in a rangeland seeding.

More specific wildlife management concerns are addressed under the heading "Plant Communities in Elko County, Northeast." Additional information about wildlife management can be obtained from local offices of the Natural Resources Conservation Service, Cooperative Extension, or Nevada Division of Wildlife.

Plant Communities of Elko County, Nevada Northeast

A rangeland ecological site is a distinctive kind of rangeland that differs from other kinds of rangeland in its ability to produce a characteristic natural plant community. An ecological site is the product of all environmental factors responsible for its development. It can support a native plant community typified by an association of species that differs from the potential plant community of other ecological sites in the kind or proportion of species or in total production. Disturbances, such as drought, fire, and grazing by native fauna, and the damage caused by insects and disease are

recognized as natural factors in the development of native plant communities.

The appendix in the section "Rangeland Plants and Woodland Understory" shows the rangeland plants and woodland understory for each soil and contrasting inclusion in the detailed soil map units, the rangeland or woodland ecological site, the common plant name and scientific plant symbol for the characteristic vegetation, the average percent composition for each species in the potential plant community, the rangeland or woodland ecological site, and the total annual production of vegetation in favorable, normal, and unfavorable years. The characteristic vegetation, which consists of the grasses, forbs, shrubs, and immature trees that make up most of the potential plant community for each soil, is listed by common name. For rangeland, the expected percentage of the total annual production is given for each species making up the characteristic vegetation. The amount that can be used as forage depends on the kinds of grazing animals, the grazing season, and the availability of forage. Many plants, trees, and shrubs are inaccessible to foraging animals. For woodland, the percentage of the total annual production is not given because of a wide variation of production under different tree canopies. The presence of a plant species in the understory vegetation is shown by an "X" in the composition section of the table.

Total potential production is the amount of vegetation that can be expected to grow annually on well managed rangeland or woodland that supports the potential natural community. It includes all vegetation, whether or not it is palatable to grazing animals. It includes the current year's production of leaves, twigs, and fruits of woody plants. It does not include the increase in stem diameter of trees and shrubs. It is expressed in pounds per acre of air-dry vegetation for favorable, normal, and unfavorable years. In a favorable year, above average amounts and optimum timing of precipitation during periods of warm temperatures make growing conditions substantially better than average. In a normal year, growing conditions are about average. In an unfavorable year, growing conditions are well below average, generally because of low available soil moisture.

Riparian areas or meadows are interspersed throughout the survey area. Riparian vegetation grows on the flood plains along perennial streams. Stringer meadows are along spring-fed stream channels where moisture is available to plants throughout most of the growing season. Meadow vegetation also grows on the periphery of seeps and

springs. Although they make up a small acreage in the survey area, the riparian zones are important because they provide free water, which improves the productivity of the riparian vegetation and lengthens the growing season of the vegetation. The zones are characterized by diverse plant species and a structural diversity of vegetation. The zones along stream channels are typically linear. The linear nature of the zones maximizes the edge effect between the zones and the adjacent uplands. An "edge," or ecotone, is a transition between plant communities or a joining of different vegetative structures within plant communities. It commonly is richer in wildlife than either of the adjoining communities.

Elko County Northeast is in the northeastern part of the Basin and Range Physiographic Province. The major plant associations in the survey area typify the general zonation of vegetation common in the Great Basin Region. Valley floors and the lower piedmont slopes are dominated by salt-desert shrub plant communities. Above the salt-desert shrub zone, sagebrush-grass plant communities are prevalent in areas where the mean annual precipitation is 8 inches or more.

Salt-desert shrub communities normally reflect either a climatically dry environment where the mean annual precipitation is less than 8 inches or physiologically dry soil conditions. High concentrations of salts that interfere with the uptake of water by plants can create physiologically dry soil conditions. Representative shrubs of the salt-desert shrub communities are shadscale, bud sagebrush, winterfat, and Douglas rabbitbrush. The common grasses include Indian ricegrass, bottlebrush squirreltail, Sandberg bluegrass, and desert needlegrass.

The salt-desert shrub plant communities in the survey area include stands dominated by a single shrub species and stands that support relatively heterogeneous mixtures of shrubs and grasses. The vegetation is generally sparse, normally covering less than 20 percent of the surface. Wind erosion and water erosion are hazards because of the naturally sparse plant cover in most areas. The interspaces between plants in salt-desert shrub communities commonly are stabilized by surface pavements of rock fragments, by a puddled and crusted soil surface, or by microphytic (algae) surface crusts. These protective features can be damaged by livestock or off-road vehicle traffic.

Salt-desert shrub plant communities are most valuable as winter range for livestock. They can produce high-quality winter forage and are usually

subject to only light snowfall. Most of the desirable forage species in these communities are adversely affected by grazing in late winter (March and April), heavy use, or both. Where native rangeland communities are grazed in winter, an emergency supply of feed should be readily available to carry livestock through periods of unusually severe weather.

Properly regulated grazing management can enhance the long-term productivity of salt-desert shrub plant communities. This management includes deferred grazing during critical growth periods in late winter, rotational grazing, and control of the intensity and season of use. Fencing, herding, water hauling, and controlling livestock access to watering facilities can achieve a better distribution of grazing. Because of the harsh environment of the salt-desert shrub zone, manipulation of vegetation and revegetation projects generally are not advisable.

Salt-desert shrub communities provide habitat for a wide variety of nongame species, including whiptail lizards, antelope ground squirrels, loggerhead shrikes, and Pacific rattlesnakes. Plant communities that are dominated by shadscale or winterfat and associated forbs and grasses provide important winter range for pronghorn antelope. Fencing can deter the migration of pronghorn antelope because these animals commonly do not jump. As a result, the lower wire of the fences should be high enough for antelope to crawl under. Where feasible, the fence lines should be routed so that they cause the least disruption to antelope travel. Livestock water developments are beneficial to antelope and other wildlife if the water is available when the animals occupy the area. Few mule deer use salt-desert shrub communities, which generally are unimportant in deer management. Feral horses use these communities in winter.

Within the salt-desert shrub zone are low areas that commonly receive extra moisture as runoff from higher landscape positions and as shallow, low-velocity overflow during periods of runoff. Black greasewood, basin big sagebrush, and basin wildrye are important plants on these sites. When in good condition, these plant communities can produce more than 2,000 pounds of basin wildrye per acre. When in poor condition, however, they typically produce less than 500 pounds per acre. The potential for increasing the production of basin wildrye is good on many sites in poor or fair condition in the survey area. Basin wildrye provides standing dried forage during its fall and winter dormancy and can provide calving areas in late winter. Mule deer, pygmy rabbits, and northern

harriers inhabit basin wildrye communities throughout the year.

Other plant communities that reflect extra moisture conditions are adjacent to valley floor playas. These areas may have a high water table during periods of runoff. Black greasewood, shadscale, inland saltgrass, and basin wildrye are the characteristic plants on these sites.

Plant communities that are dominated by black greasewood provide thermal cover for many species of wildlife but have limited value for big game. Because of its spines and coarse structure, black greasewood provides protective cover to nesting birds and small mammals. Although this species is not a preferred forage plant for livestock, cattle and sheep eat the succulent spring growth. On late fall and winter ranges, the fruit of black greasewood and shadscale provides nutritious and palatable feed. The soluble oxalates in black greasewood may be harmful to livestock, especially sheep, if the new growth is excessively grazed in spring.

As snow melts in spring, runoff commonly drains into valley floor basins. It remains for short periods, providing nesting and feeding habitat for some waterfowl. Playas containing water in spring are important resting places for migrating waterfowl. Sand dunes formed through the deposition of windblown sediment are commonly on the leeward side of the playas in this survey area. Although of limited extent, partially stabilized sand dunes provide important habitat for both predator and prey vertebrate wildlife. Kangaroo rats, kit foxes, and bobcats inhabit the sand dunes.

Sagebrush-grass plant communities are at the lower elevations (about 5,000 feet) in the survey area. The average annual precipitation at these elevations is between 8 and 10 inches.

Wyoming big sagebrush, Lahontan sagebrush (a newly recognized subspecies of low sagebrush), and, to a lesser extent, basin big sagebrush are the dominant woody sagebrush plants at the lower elevations in the survey area. Cool-season perennial grasses are potentially the dominant herbaceous plants in the sagebrush-grass plant communities. Thurber needlegrass, Indian ricegrass, bottlebrush squirreltail, and Sandberg bluegrass are important cool-season bunch grasses. Grazing pressure has been severe on the sagebrush-grass plant communities at the lower elevations. These plant communities are the first to begin growth, or "greenup," during the warming periods of early spring and have traditionally been used for spring grazing by livestock. Close grazing spring after

spring will eventually eliminate the perennial understory of grasses and forbs.

Grazing management practices can enhance the long-term productivity of sagebrush-grass communities. These practices include deferred grazing during critical growth periods in spring, rotational grazing, and control of the intensity and season of use. Fencing, herding, water hauling, and controlling livestock access to watering facilities can achieve a better distribution of grazing and facilitate grazing management.

Very few sources of perennial water are available in the sagebrush-grass zone at the lower elevations. Therefore, water developments and watering facilities are key elements in grazing management. Also, they can be of significant value to wildlife. Where the range condition has not deteriorated excessively and an adequate population of desirable perennial grasses and forbs is available to respond to a release from plant competition, brush management can greatly enhance the production of forage for livestock and wildlife.

The selection of plants available for rangeland seeding in the 8- to 10-inch precipitation zone is limited. Suitable species that are tolerant of early spring grazing, however, can be seeded. These species can play a key role in the management of grazing on the adjacent native sagebrush-grass and salt-desert shrub plant communities. Years of below normal precipitation are relatively frequent in this zone. Thus, the factors to be considered in managing rangeland seeding include the risk of seeding failure caused by climate.

Although the sagebrush-grass communities at the lower elevations may provide transitional spring range to pronghorn antelope moving from winter to summer ranges, plant communities that are dominated by big sagebrush are not heavily used by the antelope. Fencing can deter migration of the antelope because these animals commonly do not jump. As a result, the lower wire of the fences should be high enough for the antelope to crawl under. Where feasible, the fence lines should be routed so that they cause the least disruption to antelope travel. Livestock water developments are beneficial to wildlife, especially deer and antelope, if the water is available when the animals are in the area.

During severe winters in areas of the sagebrush-grass communities at the lower elevations, sage grouse may feed on sagebrush that has not been covered by snow. Heavy snow at the higher elevations forces chukar partridge to move into these areas in search of food. The sagebrush-grass

communities at the lower elevations are used primarily by mule deer and feral horses as winter range or as transitional range in spring. Spring grazing by livestock in areas used by deer as winter range should be managed so that the turn out of livestock is delayed until after spring "greenup" and the migration of most of the deer.

Sagebrush-grass communities are at intermediate elevations (about 6,000 feet) in the survey area. The average annual precipitation at these elevations is between 10 and 14 inches.

Wyoming big sagebrush dominates the shrub canopy of the mid-elevation plant communities on the warmer, drier exposures. Basin big sagebrush is most common on the deeper soils at the lower elevations in this precipitation zone. Mountain big sagebrush is prevalent on the north aspects at the lower elevations of the zone and grows on all aspects at the higher elevations. Low sagebrush is the dominant dwarf sagebrush at the mid and upper elevations in the survey area. Bluebunch wheatgrass, Thurber needlegrass, Canby bluegrass, Sandberg bluegrass, and basin wildrye are the major perennial grasses associated with these mid-elevation sagebrush-grass communities. Antelope bitterbrush is an important shrub in many plant communities at these elevations.

The mid-elevation sagebrush-grass communities are suitable for grazing by livestock in summer and fall. Deferred grazing during critical growth periods in spring and early summer, rotational grazing, and control of the intensity and season of use can enhance the long-term productivity of these communities. Fencing, herding, and strategically locating livestock watering facilities help to achieve a better distribution of grazing and facilitate grazing management. Relatively few sources of perennial water are available in areas of the mid-elevation sagebrush-grass zone. As a result, water developments and watering facilities are key elements in grazing management and can be of significant value to wildlife.

Wyoming big sagebrush communities at mid elevations are used primarily as winter range by mule deer. They commonly provide habitat for Brewer's sparrow, black-tailed jackrabbits, and sagebrush lizards. They provide wintering areas for sage grouse. Low sagebrush communities provide important summer range for pronghorn antelope and brood-rearing habitat for sage grouse. Livestock water developments can be beneficial to wildlife, especially deer and antelope, if the water is available when the animals are in the area. Mountain big sagebrush and low sagebrush communities provide

spring, summer, and fall range for mule deer and feral horses.

Seasonal grazing by livestock removes old grass residue and exposes the regrowth of succulent green stems and leaves that provide food for mule deer. The steep rock-faced cliffs common to these mid elevations have ledges, joints, cracks, and occasional caves and thus provide safe sites for birds and small mammals to nest and rear their young. The common nongame species are sage thrasher, the Great Basin gopher snake, and desert mouse. Areas of exposed lava flow rock, natural breaks in the cliffs, and the associated talus commonly are used as travel lanes by wildlife, including mule deer.

Brush management practices can be very effective in increasing the production of native forage in the mid-elevation sagebrush-grass zone. They can be beneficial to wildlife as well as livestock. Opening up large, homogeneous stands of sagebrush commonly improves the habitat for wildlife, such as mule deer and pronghorn antelope. Rangeland seeding may be required following the removal of woody vegetation where desirable understory plants are scarce or are not included in the present plant community. A number of forbs and grasses are suitable for dryland seeding in the 10-to 14-inch precipitation zone. Including suitable forbs in the seeding mixture helps to provide additional forage for wildlife, such as pronghorn antelope, mule deer, and sage grouse.

Pinyon and juniper plant communities are at mid-elevations in the survey area. Local expansion of pinyon or juniper from woodland sites to the adjacent rangeland is common. The invasion of juniper and pinyon into sagebrush-grass communities has been attributed to overgrazing, a scarcity of naturally recurring fires, and climatic conditions. Young trees are readily killed by fire. The loss of fine fuel to carry fire and, to a lesser extent, fire control have limited the frequency and extent of natural fires in the sagebrush-grass zone. This reduction in the frequency of fires has allowed seedlings to become established in increasing numbers on sites that at one time supported virtually no trees.

Livestock commonly concentrate on the woodland sites, taking advantage of the shade and shelter provided by the tree overstory. These sites also provide habitat for nongame wildlife species, including the bushy-tailed woodrat, the blue-grey gnat-catcher, and the American kestrel; thermal cover for mule deer; and habitat for small mammals and birds.

Areas that have a heterogeneous mixture of vegetative types, including grassland, low shrub, tall

shrub, and tree-shrub communities, generally provide an optimum diversity of wildlife habitat. These types of vegetative complexes are common in the sagebrush-grass zones at the intermediate and upper elevations. Moderate browsing by cattle on antelope bitterbrush in fall can enhance the vigor and growth of the bitterbrush, which is later available for grazing by mule deer and antelope.

Stringer meadows are along spring-fed stream channels in the sagebrush-grass zones at the intermediate and upper elevations. Meadow vegetation also grows on the periphery of seeps and springs. Wet meadows adjacent to sagebrush stands are important as brood-rearing areas for sage grouse. During the first weeks after leaving the nest, sage grouse chicks eat mainly insects (ants and beetles) and the succulent forbs that are common in wet meadows. Grazing of the meadows by cattle can improve the quality of feed for sage grouse if a period of regrowth is provided for the key forb species. Grazing increases the succulence of the forbs by interrupting the maturation of the plant tissues. The succulent or young leaf tissue is higher in protein and lower in fiber than mature tissue. As they seek sources of succulent forbs, sage grouse select meadows that have been grazed by cattle. Sage grouse chicks find food and cover in properly grazed meadows, which appear patchy because of different stubble heights remaining after livestock have grazed the meadows.

Improper grazing of riparian vegetation by livestock can cause gully erosion. This erosion, in turn, can result in lower water tables, the drying out of meadows, and the loss of valuable wildlife and livestock forage. Grazing management strategies that are sensitive to the development and maintenance of healthy riparian areas are needed.

The uppermost elevations of the survey area (about 7,000 feet and higher) typically support high-elevation sagebrush-grass plant communities. The average annual precipitation ranges from 14 to more than 18 inches. Mountain big sagebrush and low sagebrush dominate the shrub canopy of these plant communities. The shrub understory grasses include Idaho fescue, western needlegrass, mountain brome, Columbia needlegrass, Letterman needlegrass, basin wildrye, slender wheatgrass, and bluebunch wheatgrass. Mountain browse species, such as snowberry, serviceberry, and antelope bitterbrush, are common in the shrub overstory. Curlleaf mountainmahogany stands are at the highest elevations, on mountain summits, and the upper side slopes. Areas of aspen woodland are common in concave pockets and along riparian zones.

Plant communities on the high-elevation sites are potentially very productive and normally respond rapidly to management. These sites remain cold and wet through spring and into early summer. They are used as summer range for livestock. Grazing should be delayed until the surface layer has dried sufficiently for compaction to be limited. Snow often blankets these sites by late fall, further restricting the period of livestock grazing. Steeply sloping areas are common throughout the high-elevation sagebrush-grass zone. Livestock tend to overuse the less sloping areas unless grazing is managed for an even distribution of grazing. Fencing, properly locating watering facilities, and herding force livestock to use areas that otherwise might remain ungrazed. Salt and mineral blocks should be placed away from water.

Mule deer use the high-elevation plant communities for summer range. North-facing slopes that have a patchwork of dense stands consisting of mountain browse are important deer-fawning areas. These dense stands should be maintained because they provide cover for wildlife. Areas of aspen woodland provide important cover for wildlife and are a source of shade for livestock and wildlife.

Seeps and springs are common at the high elevations. Water for livestock generally is readily available. Additional water developments may be needed, however, to distribute the livestock evenly. Developed springs, pipelines, and storage tanks are dependable means of supplying water. Seeps and

springs developed to provide livestock water can also be beneficial to wildlife. Excluding livestock by fencing the meadow around a seep or spring and piping the water to troughs or other storage facilities outside the enclosure help to protect the meadow vegetation grazed by wildlife. Enough water must be retained in the fenced seep or spring area to maintain the meadow vegetation. Small meadows can be developed and maintained by piping overflow water from livestock troughs into fenced areas.

Many naturally occurring meadows in the sagebrush-grass zones at the mid and higher elevations have been heavily invaded by big sagebrush. The sagebrush depletes moisture from the meadows. If the sagebrush is removed, the quantity of water and the duration of waterflow increase as grasses return to the meadows. Prescribed burning of dense sagebrush stands can be an economical means of brush management in the high-elevation sagebrush-grass zone. Brush management practices should be designed so that enough of the shrub canopy remains near meadows to provide cover for wildlife.

Rangeland seeding of the high-elevation plant communities is usually not necessary. In most areas, the remnant population of desirable forbs and grasses is sufficient to respond to grazing management and a release from shrub competition. Where rangeland seeding is needed, a wide variety of suitable species can be planted because of the relatively high annual precipitation in this zone.

Forest Land

Table 7, "Woodland Management and Productivity," can be used by forest managers in planning the use of soils for wood crops. Only those soils suitable for wood crops are listed.

Woodland Ordination System

Table 7, "Woodland Management and Productivity," lists the ordination (woodland suitability) symbol for each soil. The ordination system is a nationwide uniform system of labeling soils or groups of soils that are similar in use and management. The primary factors evaluated in the woodland ordination system are productivity of the forest overstory tree species and the principal soil properties resulting in hazards and limitations that affect forest management. There are three parts of the ordination system: class, subclass, and group. The class and subclass are referred to as the ordination symbol.

Ordination Class Symbol

The first element of the ordination symbol is a number that denotes potential productivity in terms of cubic meters of wood per hectare per year for the indicator tree species. The larger the number, the greater the potential productivity. Potential productivity is based on site index and the corresponding culmination of mean annual increment. For example, the number 1 indicates a potential production of 1 cubic meter of wood per hectare per year (14.3 cubic feet per acre per year) and 10 indicates a potential production of 10 cubic meters of wood per hectare per year (143 cubic feet per acre per year).

Indicator species is a species that is common in the area and is generally, but not necessarily, the most productive on the soil. It is the species that determines the ordination class. It is the first species listed for a particular map unit in table 7, "Woodland Management and Productivity." This table shows

the productivity for all species where data have been collected.

Site index is determined by taking height measurements and determining the age of selected trees within stands of a given species. This index is the average height, in feet, that the trees attain in a specified number of years. This index applies to fully stocked, even-aged, unmanaged stands. The site indexes shown in table 7, "Woodland Management and Productivity," are averages based on measurements made at sites that are representative of the soil series. When the site index and forest land productivity of different soils are compared, the values for the same tree species should be compared. The higher the site index number, the more productive the soil for that species. Site index values are used in conjunction with yield tables to determine average annual yields. Indirectly, they are used to determine the productivity class in the ordination class symbol.

Ordination Subclass Symbol

The second element of the ordination symbol, or subclass, is a capital letter that indicates certain soil or physiographic characteristics that contribute to important hazards or limitations to be considered in management. The subclasses are defined as follows:

Subclass X indicates that forest land use and management are limited by stones or rocks.

Subclass W indicates that forest land use and management are significantly limited by excess water, either seasonally or throughout the year. Restricted drainage, a high water table, or flooding can adversely affect either stand development or management.

Subclass T indicates that the root zone has toxic substances. Excessive alkalinity, acidity, sodium salts, or other toxic substances impede the development of desirable species.

Subclass D indicates that forest land use and management are limited by a restricted rooting depth. The rooting depth is restricted by hard

bedrock, a hardpan, or other restrictive layers in the soil.

Subclass C indicates that forest land use and management are limited by the kind or amount of clay in the upper part of the soil.

Subclass S indicates that the soil is sandy, has a low available water capacity, and normally has a low content of available plant nutrients. The use of equipment is limited during dry periods.

Subclass F indicates that forest land use and management are limited by a high content of rock fragments that are larger than 2 millimeters and smaller than 10 inches. This subclass includes flaggy soils.

Subclass R indicates that forest land use and management are limited by excessive slope.

Subclass A indicates that no significant limitations affect forest land use and management.

Forest Land Management and Productivity

Information about the productivity and management of the forested map units in the survey area is given in table 7, "Woodland Management and Productivity."

Management Concerns

In table 7, "Woodland Management and Productivity," the soils are rated for the erosion hazard, the equipment limitation, seedling mortality, the windthrow hazard, and plant competition.

The *erosion hazard* is *slight* if the expected soil loss is small; *moderate* if some measures are needed to control erosion during logging and road construction; and *severe* if intensive management or special equipment and methods are needed to prevent excessive soil loss.

The *equipment limitation* is *slight* if the use of equipment is not limited to a particular kind of

equipment or time of year; *moderate* if there is a short seasonal limitation or a need for some modification in the management of equipment; and *severe* if there is a seasonal limitation, a need for special equipment or management, or a hazard in the use of equipment.

Seedling mortality ratings are for seedlings that are from a good planting stock and that are properly planted during a period of average rainfall. A rating of *slight* indicates that the expected mortality of the planted seedlings is less than 25 percent; *moderate*, 25 to 50 percent; and *severe*, more than 50 percent.

Windthrow hazard is *slight* if trees in wooded areas are not expected to be blown down by commonly occurring winds; *moderate* if some trees are blown down during periods of excessive soil wetness and strong winds; and *severe* if many trees are blown down during periods of excessive soil wetness and moderate or strong winds.

Plant competition is *slight* if there is little or no competition from other plants; *moderate* if plant competition is expected to hinder the development of a fully stocked stand of desirable trees; and *severe* if plant competition is expected to prevent the establishment of a desirable stand unless the site is intensively prepared, weeded, or otherwise managed for the control of undesirable plants.

Potential Productivity

The potential productivity of merchantable or *common trees* is expressed as a site index, which is described under the heading "Ordination Class Symbol." Commonly grown trees are those that forest land managers generally favor in intermediate or improvement cuttings. They are selected on the basis of growth rate, quality, value, and marketability.

Engineering

This section provides information for planning land uses related to urban development and to water management. Soils are rated for various uses, and the most limiting features are identified. Ratings are given for building site development, sanitary facilities, construction materials, and water management. The ratings are based on observed performance of the soils and on the estimated data and test data in the "Soil Properties" section.

Information in this section is intended for land use planning, for evaluating land use alternatives, and for planning site investigations prior to design and construction. The information, however, has limitations. For example, estimates and other data generally apply only to that part of the soil within a depth of 5 or 6 feet. Because of the map scale, small areas of different soils may be included within the mapped areas of a specific soil.

The information is not site specific and does not eliminate the need for onsite investigation of the soils or for testing and analysis by personnel experienced in the design and construction of engineering works.

Government ordinances and regulations that restrict certain land uses or impose specific design criteria were not considered in preparing the information in this section. Local ordinances and regulations should be considered in planning, in site selection, and in design.

Soil properties, site features, and observed performance were considered in determining the ratings in this section. During the fieldwork for this soil survey, determinations were made about grain-size distribution, liquid limit, plasticity index, soil reaction, depth to bedrock, hardness of bedrock within 5 or 6 feet of the surface, soil wetness, depth to a seasonal high water table, slope, likelihood of flooding, natural soil structure aggregation, and soil density. Data were collected about kinds of clay minerals, mineralogy of the sand and silt fractions, and the kind of adsorbed cations. Estimates were made for erodibility, permeability, corrosivity, shrink-swell potential, available water

capacity, and other behavioral characteristics affecting engineering uses.

This information can be used to evaluate the potential of areas for residential, commercial, industrial, and recreational uses; make preliminary estimates of construction conditions; evaluate alternative routes for roads, streets, highways, pipelines, and underground cables; evaluate alternative sites for sanitary landfills, septic tank absorption fields, and sewage lagoons; plan detailed onsite investigations of soils and geology; locate potential sources of gravel, sand, earthfill, and topsoil; plan drainage systems, irrigation systems, ponds, terraces, and other structures for soil and water conservation; and predict performance of proposed small structures and pavements by comparing the performance of existing similar structures on the same or similar soils.

The information in the tables, along with the soil maps, the soil descriptions, and other data provided in this survey, can be used to make additional interpretations.

Some of the terms used in this soil survey have a special meaning in soil science and are defined in the "Glossary."

Waste Management

Soil properties are important when organic waste is applied as fertilizer and wastewater is applied in irrigated areas. They also are important when the soil is used as a medium for the treatment and disposal of the organic waste and wastewater. Unfavorable soil properties can result in environmental damage.

The use of organic waste and wastewater as production resources results in energy and resource conservation and minimizes the problems associated with waste disposal. If disposal is the goal, applying a maximum amount of the organic waste or the waste water to a minimal area holds costs to a minimum and environmental damage is the main

hazard. If reuse is the goal, a minimum amount should be applied to a maximum area and environmental damage is unlikely.

Interpretations developed for waste management may include ratings for manure- and food-processing waste, municipal sewage sludge, use of wastewater for irrigation, and treatment of wastewater by slow rate, overland flow, and rapid infiltration processes.

Specific information regarding waste management is available at the local office of the Natural Resources Conservation Service or Cooperative Extension.

Construction Materials

Table 8, "Construction Materials," gives information about the soils as a source of roadfill, sand, gravel, and topsoil. The soils are rated *good*, *fair*, or *poor* as a source of roadfill and topsoil. They are rated as a *probable* or *improbable* source of sand and gravel.

Roadfill is soil material that is excavated in one place and used in road embankments in another place. In table 8, "Construction Materials," the soils are rated as a source of roadfill for low embankments, generally less than 6 feet high and less exacting in design than higher embankments.

The ratings are for the soil material below the surface layer to a depth of 5 or 6 feet. It is assumed that soil layers will be mixed during excavating and spreading. Many soils have layers of contrasting suitability within their profile. The table showing engineering index properties provides detailed information about each soil layer. This information can help to determine the suitability of each layer for use as roadfill. The performance of soil after it is stabilized with lime or cement is not considered in the ratings.

The ratings are based on soil properties, site features, and observed performance of the soils. The thickness of suitable material is a major consideration. The ease of excavation is affected by large stones, a high water table, and slope. How well the soil performs in place after it has been compacted and drained is determined by its strength (as inferred from the engineering classification of the soil) and shrink-swell potential.

Soils rated *good* contain significant amounts of sand or gravel, or both. They have at least 5 feet of suitable material, a low shrink-swell potential, few cobbles and stones, and slopes of 15 percent or less. Depth to the water table is more than 3 feet. Soils rated *fair* are more than 35 percent silt- and

clay-sized particles and have a plasticity index of less than 10. They have a moderate shrink-swell potential, slopes of 15 to 25 percent, or many stones. Depth to the water table is 1 to 3 feet. Soils rated *poor* have one or more of the following characteristics: a plasticity index of more than 10, a high shrink-swell potential, many stones, slopes of more than 25 percent, or a water table at a depth of less than 1 foot. They may have layers of suitable material, but the material is less than 3 feet thick.

Sand and *gravel* are natural aggregates suitable for commercial use with a minimum of processing. They are used in many kinds of construction.

Specifications for each use vary widely. In table 8, "Construction Materials," only the probability of finding material in suitable quantity in or below the soil is evaluated. The suitability of the material for specific purposes is not evaluated, nor are factors that affect excavation of the material.

The properties used to evaluate the soil as a source of sand or gravel are gradation of grain sizes (as indicated by the engineering classification of the soil), the thickness of suitable material, and the content of rock fragments. Kinds of rock, acidity, and stratification are given in the soil series descriptions. Gradation of grain sizes is given in the table on engineering index properties.

A soil rated as a probable source has a layer of clean sand or gravel or a layer of sand or gravel that is as much as 12 percent silty fines. This material must be at least 3 feet thick and less than 50 percent, by weight, large stones. All other soils are rated as an improbable source. Fragments of soft bedrock, such as shale and siltstone, are not considered to be sand and gravel.

Topsoil is used to cover an area so that vegetation can be established and maintained. The upper 40 inches of a soil is evaluated for use as topsoil. Also evaluated is the reclamation potential of the borrow area.

Plant growth is affected by toxic material and by such properties as soil reaction, available water capacity, and fertility. The ease of excavating, loading, and spreading is affected by rock fragments, slope, a water table, soil texture, and thickness of suitable material. Reclamation of the borrow area is affected by slope, a water table, rock fragments, bedrock, and toxic material.

Soils rated *good* have friable, loamy material to a depth of at least 40 inches. They are free of stones and cobbles, have little or no gravel, and have slopes of less than 8 percent. They are low in content of soluble salts, are naturally fertile or

respond well to fertilizer, and are not so wet that excavation is difficult.

Soils rated *fair* are sandy soils, loamy soils that have a relatively high content of clay, soils that have only 20 to 40 inches of suitable material, soils that have an appreciable amount of gravel, stones, or soluble salts, or soils that have slopes of 8 to 15 percent. The soils are not so wet that excavation is difficult.

Soils rated *poor* are very sandy or clayey; have less than 20 inches of suitable material; have a large amount of gravel, stones, or soluble salts; have

slopes of more than 15 percent; or have a seasonal high water table at or near the surface.

The surface layer of most soils generally is preferred for topsoil because of its organic matter content. Organic matter greatly increases the absorption and retention of moisture and nutrients for plant growth.

Soil Properties

Data relating to soil properties are collected during the course of the soil survey. The data and the estimates of soil and water features listed in tables are explained on the following pages.

Soil properties are determined by field examination of the soils and by laboratory index testing of some benchmark soils. Established standard procedures are followed. During the survey, many shallow borings are made and examined to identify and classify the soils and to delineate them on the soil maps. Samples are taken from some typical profiles and tested in the laboratory to determine grain-size distribution, plasticity, and compaction characteristics.

Estimates of soil properties are based on field examinations, on laboratory tests of samples from the survey area, and on laboratory tests of samples of similar soils in nearby areas. Tests verify field observations, verify properties that cannot be estimated accurately by field observation, and help to characterize key soils.

The estimates of soil properties shown in the tables include the range of grain-size distribution and Atterberg limits, the engineering classification, and the physical and chemical properties of the major layers of each soil. Pertinent soil and water features also are given.

Engineering Index Properties

Table 9, "Engineering Index Properties" gives estimates of the engineering classification and of the range of index properties for the major layers of each soil in the survey area. Most soils have layers of contrasting properties within the upper 5 or 6 feet.

Depth to the upper and lower boundaries of each layer is indicated. The range in depth and information on other properties of each layer are given in the series descriptions in Part I of this survey.

Texture is given in the standard terms used by the U.S. Department of Agriculture. These terms are defined according to percentages of sand, silt, and clay in the fraction of the soil that is less than 2 millimeters in diameter. "Loam," for example, is soil that is 7 to 27 percent clay, 28 to 50 percent silt, and less than 52 percent sand. If the content of particles coarser than sand is as much as 15 percent, an appropriate modifier is added, for example, "gravelly." Textural terms are defined in the "Glossary."

Classification of the soils is determined according to the system adopted by the American Association of State Highway and Transportation Officials (1) and the Unified soil classification system (2).

The Unified system classifies soils according to properties that affect their use as construction material. Soils are classified according to grain-size distribution of the fraction less than 3 inches in diameter and according to plasticity index, liquid limit, and organic matter content. Sandy and gravelly soils are identified as GW, GP, GM, GC, SW, SP, SM, and SC; silty and clayey soils as ML, CL, OL, MH, CH, and OH; and highly organic soils as PT. Soils exhibiting engineering properties of two groups can have a dual classification, for example, SP-SM.

The AASHTO system classifies soils according to those properties that affect roadway construction and maintenance. In this system, the fraction of a mineral soil that is less than 3 inches in diameter is classified in one of seven groups from A-1 through A-7 on the basis of grain-size distribution, liquid limit, and plasticity index. Soils in group A-1 are coarse grained and low in content of fines (silt and clay). At the other extreme, soils in group A-7 are fine grained. Highly organic soils are classified in group A-8 on the basis of visual inspection.

If laboratory data are available, the A-1, A-2, and A-7 groups are further classified as A-1-a, A-1-b, A-2-4, A-2-5, A-2-6, A-2-7, A-7-5, or A-7-6. As an additional refinement, the suitability of a soil as subgrade material can be indicated by a group index

number. Group index numbers range from 0 for the best subgrade material to 20 or higher for the poorest.

Rock fragments larger than 10 inches in diameter and 3 to 10 inches in diameter are indicated as a percentage of the total soil on a dry-weight basis. The percentages are estimates determined mainly by converting volume percentage in the field to weight percentage.

Percentage (of soil particles) passing designated sieves is the percentage of the soil fraction less than 3 inches in diameter based on an oven-dry weight. The sieves, numbers 4, 10, 40, and 200 (USA Standard Series), have openings of 4.76, 2.00, 0.420, and 0.074 millimeters, respectively. Estimates are based on laboratory tests of soils sampled in the survey area and in nearby areas and on estimates made in the field.

Liquid limit and *plasticity index* (Atterberg limits) indicate the plasticity characteristics of a soil. The estimates are based on test data from the survey area or from nearby areas and on field examination.

The estimates of grain-size distribution, liquid limit, and plasticity index are generally rounded to the nearest 5 percent. Thus, if the ranges of gradation and Atterberg limits extend a marginal amount (1 or 2 percentage points) across classification boundaries, the classification in the marginal zone is omitted in the table.

Physical and Chemical Properties

Table 10, "Physical Properties of the Soils," and table 11, "Chemical Properties of the Soils," show estimates of some characteristics and features that affect soil behavior. These estimates are given for the major layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

Depth to the upper and lower boundaries of each layer is indicated. The range in depth and information on other properties of each layer are given in the series descriptions in Part I of this survey.

Clay as a soil separate, or component, consists of mineral soil particles that are less than 0.002 millimeter in diameter. The estimated clay content of each major soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The amount and kind of clay greatly affect the fertility and physical condition of the soil. They determine the ability of the soil to adsorb cations

and to retain moisture. They influence shrink-swell potential, permeability, plasticity, the ease of soil dispersion, and other soil properties. The amount and kind of clay in a soil also affect tillage and earth-moving operations.

Moist bulk density is the weight of soil (oven-dry) per unit volume. Volume is measured when the soil is at field moisture capacity, that is, the moisture content at 1/3-bar moisture tension. Weight is determined after drying the soil at 105 degrees C. In table 10, "Physical Properties of the Soils," the estimated moist bulk density of each major soil horizon is expressed in grams per cubic centimeter of soil material that is less than 2 millimeters in diameter. Bulk density data are used to compute shrink-swell potential, available water capacity, total pore space, and other soil properties. The moist bulk density of a soil indicates the pore space available for water and roots. A bulk density of more than 1.6 can restrict water storage and root penetration. Moist bulk density is influenced by texture, kind of clay, content of organic matter, and soil structure.

Permeability refers to the ability of a soil to transmit water or air. The estimates indicate the rate of downward movement of water when the soil is saturated. They are based on soil characteristics observed in the field, particularly structure, porosity, and texture. Permeability is considered in the design of soil drainage systems and septic tank absorption fields.

Available water capacity refers to the quantity of water that the soil is capable of storing for use by plants. The capacity for water storage is given in inches of water per inch of soil for each major soil layer. The capacity varies depending on soil properties that affect the retention of water and the depth of the root zone. The most important properties are the content of organic matter, soil texture, bulk density, and soil structure. Available water capacity is an important factor in the choice of plants or crops to be grown and in the design and management of irrigation systems. Available water capacity is not an estimate of the quantity of water actually available to plants at any given time.

Shrink-swell potential is the potential for volume change in a soil with a loss or gain in moisture. Volume change occurs mainly because of the interaction of clay minerals with water and varies with the amount and type of clay minerals in the soil. The size of the load on the soil and the magnitude of the change in soil moisture content influence the amount of swelling of soils in place. Laboratory measurements of swelling of undisturbed clods were made for many soils. For others, swelling

was estimated on the basis of the kind and amount of clay minerals in the soil and on measurements of similar soils.

If the shrink-swell potential is rated moderate to very high, shrinking and swelling can cause damage to buildings, roads, and other structures. Special design is often needed.

Shrink-swell potential classes are based on the change in length of an unconfined clod as moisture content is increased from air-dry to field capacity. The classes are *low*, a change of less than 3 percent; *moderate*, 3 to 6 percent; and *high*, more than 6 percent. *Very high*, more than 9 percent, is sometimes used.

Organic matter is the plant and animal residue in the soil at various stages of decomposition. In table 10, "Physical Properties of Soils," the estimated content of organic matter is expressed as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The content of organic matter in a soil can be maintained or increased by returning crop residue to the soil. Organic matter affects the available water capacity, infiltration rate, and tilth. It is a source of nitrogen and other nutrients for crops.

Erosion factor K indicates the susceptibility of a soil to sheet and rill erosion. Factor K is one of six factors used in the Universal Soil Loss Equation (USLE) to predict the average rate of soil loss by sheet and rill erosion in tons per acre per year. The estimates are based primarily on percentage of silt, very fine sand, sand, and organic matter (as much as 4 percent) and on soil structure and permeability. The estimates are modified by the presence of rock fragments. Values of K range from 0.02 to 0.69. The higher the value, the more susceptible the soil is to sheet and rill erosion.

Erosion factor Kf indicates the erodibility of the fine-earth fraction, or the material less than 2 millimeters in size.

Erosion factor T is an estimate of the maximum average rate of soil erosion by wind or water that can occur without affecting crop productivity over a sustained period. The rate is in tons per acre per year.

Wind erodibility groups are made up of soils that have similar properties affecting their resistance to soil blowing in cultivated areas. The groups indicate the susceptibility of soil to soil blowing. Soils are grouped according to the following distinctions:

1. Coarse sands, sands, fine sands, and very fine sands. These soils generally are not suitable for crops. They are extremely erodible and vegetation is difficult to establish.

2. Loamy coarse sands, loamy sands, loamy fine sands, loamy very fine sands, and sapric soil material. These soils are very highly erodible. Crops can be grown if intensive measures to control soil blowing are used.

3. Coarse sandy loams, sandy loams, fine sandy loams, and very fine sandy loams. These soils are highly erodible. Crops can be grown if intensive measures to control soil blowing are used.

- 4L. Calcareous loams, silt loams, clay loams, and silty clay loams that have more than 5 percent finely divided calcium carbonate. These soils are highly erodible. Crops can be grown if intensive measures to control soil blowing are used.

4. Clays, silty clays, noncalcareous clay loams, and silty clay loams that are more than 35 percent clay. These soils are moderately erodible. Crops can be grown if measures to control soil blowing are used.

5. Noncalcareous loams and silt loams that are less than 20 percent clay and sandy clay loams, sandy clays, and hemic soil material. These soils have less than 5 percent finely divided calcium carbonate. These soils are moderately erodible. Crops can be grown if measures to control soil blowing are used.

6. Noncalcareous loams and silt loams that are more than 20 percent clay and noncalcareous clay loams that are less than 35 percent clay. These soils have less than 5 percent finely divided calcium carbonate. These soils are moderately erodible. Crops can be grown if ordinary measures to control soil blowing are used.

7. Silts, noncalcareous silty clay loams that are less than 35 percent clay, and fibric soil material. These soils have less than 5 percent finely divided calcium carbonate. These soils are very slightly erodible. Crops can be grown if ordinary measures to control soil blowing are used.

8. Soils that are not subject to soil blowing because of rock fragments on the surface or because of surface wetness.

Wind erodibility index is a numerical value indicating the susceptibility of soil to soil blowing, or the tons per acre per year that can be expected to be lost to soil blowing. There is a close correlation between soil blowing and the size and durability of surface clods, rock fragments, organic matter, and a calcareous reaction. Soil moisture and frozen soil layers also influence soil blowing.

Cation-exchange capacity is the total amount of exchangeable cations that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated

pH value. Soils having a low cation-exchange capacity hold fewer cations and may require more frequent applications of fertilizer than soils having a high cation-exchange capacity. Soils having a high cation-exchange capacity can retain cations. The ability to retain cations helps to prevent the pollution of ground water.

Soil reaction is a measure of acidity or alkalinity and is expressed as a range in pH values. The range in pH of each major horizon is based on many field tests. For many soils, values have been verified by laboratory analyses. Soil reaction is important in selecting crops and other plants, in evaluating soil amendments for fertility and stabilization, and in determining the risk of corrosion.

Calcium carbonate equivalent is the percent of carbonates, by weight, in the soil. The availability of plant nutrients is influenced by the amount of carbonates in the soil. Incorporating nitrogen fertilizer into calcareous soils helps to prevent nitrite accumulation and ammonium-N volatilization.

Gypsum is given as the percent, by weight, of hydrated calcium sulfates in the soil. Gypsum is partially soluble in water and can be dissolved and removed by water. Soils that have a high content of gypsum (more than 10 percent) may collapse if the gypsum is removed by percolating water.

Salinity is a measure of soluble salts in the soil at saturation. It is expressed as the electrical conductivity of the saturation extract, in millimhos per centimeter at 25 degrees C. Estimates are based on field and laboratory measurements at representative sites of nonirrigated soils. The salinity of irrigated soils is affected by the quality of the irrigation water and by the frequency of water application. Hence, the salinity of soils in individual fields can differ greatly from the value given in the table. Salinity affects the suitability of a soil for crop production, the stability of the soil if used as construction material, and the potential of the soil to corrode metal and concrete.

Sodium adsorption ratio is the measure of sodium relative to calcium and magnesium in the water extract from saturated soil paste. Soils having a sodium adsorption ratio of 13 or more may be characterized by an increased dispersion of organic matter and clay particles, reduced permeability and aeration, and a general degradation of soil structure.

Water Features

Table 12, "Water Features" gives estimates of several important water features used in land use

planning that involves engineering considerations. These features are described in the following paragraphs.

Hydrologic soil groups are groups of soils that, when saturated, have the same runoff potential under similar storm and ground cover conditions. The soil properties that affect the runoff potential are those that influence the minimum rate of infiltration in a bare soil after prolonged wetting and when the soil is not frozen. These properties include the depth to a seasonal high water table, the intake rate, permeability after prolonged wetting, and the depth to a very slowly permeable layer. The influences of ground cover and slope are treated independently and are not taken into account in hydrologic soil groups.

In the definitions of the hydrologic soil groups, the infiltration rate is the rate at which water enters the soil at the surface and is controlled by surface conditions. The transmission rate is the rate at which water moves through the soil and is controlled by properties of the soil layers.

The four hydrologic soil groups are:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist chiefly of very deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well or well drained soils that have a moderately fine to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils that have a moderately fine or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clayey soils that have a high shrink-swell potential, soils that have a permanent high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

Flooding, the temporary covering of the soil surface by flowing water, is caused by overflow from streams or by runoff from adjacent slopes. Shallow water standing or flowing for short periods after rainfall or snowmelt is not considered flooding.

Standing water in marshes and swamps or in closed depressions is considered to be ponding.

Table 12, "Water Features," gives the frequency and duration of flooding and the time of year when flooding is most likely to occur. Frequency, duration, and probable dates of occurrence are estimated. Frequency generally is expressed as none, rare, occasional, or frequent. *None* means flooding is not probable; *rare* that it is unlikely but is possible under unusual weather conditions (the chance of flooding is nearly 0 percent to 5 percent in any year); *occasional* that it occurs infrequently under normal weather conditions (the chance of flooding is 5 to 50 percent in any year); and *frequent* that it occurs often under normal weather conditions (the chance of flooding is 50 percent in any year). The term *common* includes both frequent and occasional flooding.

Duration is expressed as *very brief* (less than 2 days), *brief* (2 to 7 days), *long* (7 to 30 days), and *very long* (more than 30 days). The time of year that flooding is most likely to occur is expressed in months. About two-thirds to three-fourths of all flooding occurs during the stated period.

The information on flooding is based on evidence in the soil profile, namely thin strata of gravel, sand, silt, or clay deposited by floodwater; irregular decrease in organic matter content with increasing depth; and little or no horizon development.

Also considered are local information about the extent and level of flooding and the relation of each soil on the landscape to historic floods. Information on the extent of flooding based on soil data is less specific than that provided by detailed engineering surveys that delineate flood-prone areas at specific flood frequency levels.

High water table (seasonal) is a zone of saturation at the highest average depth during the wettest season. It is at least 6 inches thick, persists in the soil for more than a few weeks, and is within 6 feet of the surface. Indicated in table 12, "Water Features," are the depth to the seasonal high water table, the kind of water table, and the months of the year when the water table usually is highest.

An *apparent* water table is indicated by the level at which water stands in a freshly dug, unlined borehole after adequate time for adjustments in the surrounding soil.

A *perched* water table is one that is above an unsaturated zone in the soil. The basis for determining that a water table is perched may be general knowledge of the area. The water table is proven to be perched if the water level in a borehole is observed to fall when the borehole is extended.

Two numbers in the column showing depth to the water table indicate the normal range in depth to a saturated zone. Depth is given to the nearest half foot. The first numeral in the range indicates the highest water level. A plus sign preceding the range in depth indicates that the water table is above the surface of the soil. "More than 6.0" indicates that the water table is below a depth of 6 feet or that it is within a depth of 6 feet for less than a month.

Ponding is standing water in a closed depression. Unless a drainage system is installed, the water is removed only by percolation, transpiration, or evaporation.

Soil Features

Table 13, "Soil Features," gives estimates of several important soil features used in land use planning that involves engineering considerations. These features are described in the following paragraphs.

Depth to bedrock is given if bedrock is within a depth of 60 inches. The depth is based on many soil borings and on observations during soil mapping. The rock is specified as either soft or hard. If the rock is soft or fractured, excavations can be made with trenching machines, backhoes, or small rippers. If the rock is hard or massive, blasting or special equipment generally is needed for excavation.

A *cemented pan* is a nearly continuous layer of indurated or strongly cemented material that is hard and brittle. The particles are held together by cementing substances, such as calcium carbonate and oxides of silicon, iron, or aluminum. Pans are identified when they are within a depth of 60 inches. They are classified as thin or thick. A *thin* pan can be excavated by trenching machines, backhoes, small rippers, and other equipment commonly used to dig excavations for pipelines, sewer lines, and graves. A *thick* pan is so thick or massive that blasting or special equipment is needed when excavations are made.

Subsidence is the settlement of organic soils or of saturated mineral soils of very low density. Subsidence generally results from either desiccation and shrinkage or oxidation of organic material, or both, following drainage. Subsidence takes place gradually, usually over a period of several years. Table 13, "Soil Features," shows the expected initial subsidence, which usually is a result of drainage, and total subsidence, which results from a combination of factors.

Potential frost action is the likelihood of upward or lateral expansion of the soil caused by the formation of segregated ice lenses (frost heave) and the subsequent collapse of the soil and loss of strength on thawing. Frost action occurs when moisture moves into the freezing zone of the soil.

Temperature, texture, density, permeability, content of organic matter, and depth to the water table are the most important factors considered in evaluating the potential for frost action. It is assumed that the soil is not insulated by vegetation or snow and is not artificially drained. Silty and highly structured, clayey soils that have a high water table in winter are the most susceptible to frost action. Well drained, very gravelly, or very sandy soils are the least susceptible. Frost heave and low soil strength during thawing cause damage mainly to pavements and other rigid structures.

A *low* potential for frost action indicates that the soil is rarely susceptible to the formation of ice lenses; a *moderate* potential indicates that the soil is susceptible to formation of ice lenses, resulting in frost heave and the subsequent loss of soil strength; and a *high* potential indicates that the soil is highly susceptible to formation of ice lenses, resulting in frost heave and the subsequent loss of soil strength.

Risk of corrosion pertains to potential soil-induced electrochemical or chemical action that dissolves or weakens uncoated steel or concrete. The rate of

corrosion of uncoated steel is related to such factors as soil moisture, particle-size distribution, acidity, and electrical conductivity of the soil. The rate of corrosion of concrete is based mainly on the sulfate and sodium content, texture, moisture content, and acidity of the soil.

Special site examination and design may be needed if the combination of factors results in a severe hazard of corrosion. The steel in installations that intersect soil boundaries or soil layers is more susceptible to corrosion than steel in installations that are entirely within one kind of soil or within one soil layer.

For uncoated steel, the risk of corrosion, expressed as *low*, *moderate*, or *high*, is based on soil drainage class, total acidity, electrical resistivity near field capacity, and electrical conductivity of the saturation extract.

For concrete, the risk of corrosion is also expressed as *low*, *moderate*, or *high*. It is based on soil texture, acidity, and amount of sulfates in the saturation extract.

Glossary

- Aeration, soil.** The exchange of air in soil with air from the atmosphere. The air in a well aerated soil is similar to that in the atmosphere; the air in a poorly aerated soil is considerably higher in carbon dioxide and lower in oxygen.
- Aggregate, soil.** Many fine particles held in a single mass or cluster. Natural soil aggregates, such as granules, blocks, or prisms, are called peds. Clods are aggregates produced by tillage or logging.
- Alkali (sodic) soil.** A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.
- Alluvial cone.** The material washed down the sides of mountains and hills by ephemeral streams and deposited at the mouth of gorges in the form of a moderately steep, conical mass descending equally in all directions from the point of issue.
- Alluvial fan.** The fanlike deposit of a stream where it issues from a narrow valley upon a plain, or of a tributary stream near or at its junction with its main stream.
- Alluvial flat.** A nearly level, graded, alluvial surface in bolsons and semi-bolsons. Commonly, an alluvial flat does not manifest terraces or floodplain levels.
- Alluvium.** Material, such as sand, silt, or clay, deposited on land by streams.
- Alpha,alpha-dipyridyl.** A dye that when dissolved in 1N ammonium acetate is used to detect the presence of reduced iron (Fe II) in the soil. A positive reaction indicates a type of redoximorphic feature.
- Animal unit month (AUM).** The amount of forage required by one mature cow of approximately 1,000 pounds weight, with or without a calf, for 1 month.
- Aquic conditions.** Current soil wetness characterized by saturation, reduction, and redoximorphic features.
- Area reclaim (in tables).** An area difficult to reclaim after the removal of soil for construction and other uses. Revegetation and erosion control are extremely difficult.
- Argillic horizon.** A subsoil horizon characterized by an accumulation of illuvial clay.
- Argillite.** Weakly metamorphosed mudstone or shale.
- Arroyo.** The flat-floored channel of an ephemeral stream, commonly with very steep to vertical banks cut in alluvium.
- Aspect.** The direction in which a slope faces.
- Association, soil.** A group of soils or miscellaneous areas geographically associated in a characteristic repeating pattern and defined and delineated as a single map unit.
- Available water capacity (available moisture capacity).** The capacity of soils to hold water available for use by most plants. It is commonly defined as the difference between the amount of soil water at field moisture capacity and the amount at wilting point. It is commonly expressed as inches of water per inch of soil. The capacity, in inches, in a 60-inch profile or to a limiting layer is expressed as:
- | | |
|----------------|---------------|
| Very low | 0 to 3.5 |
| Low | 3.5 to 5 |
| Moderate | 5 to 7.5 |
| High | more than 7.5 |
- Avalanche chute.** The track or path formed by an avalanche.
- Back slope.** The geomorphic component that forms the steepest inclined surface and principal element of many hillsides. Back slopes in profile are commonly steep, are linear, and may or may not include cliff segments.
- Backswamp.** A floodplain landform of extensive, marshy, or swampy, depressed areas of flood

plains between natural levees and valley sides or terraces.

Badland. Steep or very steep, commonly nonstony, barren land dissected by many intermittent drainage channels. Badland is most common in semiarid and arid regions where streams are entrenched in soft geologic material. Local relief generally ranges from 25 to 500 feet. Runoff potential is very high, and geologic erosion is active.

Ballena. A fan remnant having a distinctively-rounded surface of fan alluvium. The ballena's broadly rounded shoulders meet from either side to form a narrow summit and merge smoothly with concave, short pediments which form smoothly-rounded drainageways between adjacent ballenas. A partial ballena is a fan remnant large enough to retain some relict fan surface on a remnant summit.

Barrier beach. A wide gently sloping portion of a bolson floor comprising numerous, parallel, relict longshore-bars and lagoons built by a receding pluvial lake.

Basal area. The area of a cross section of a tree, generally referring to the section at breast height and measured outside the bark. It is a measure of stand density, commonly expressed in square feet.

Base saturation. The degree to which material having cation-exchange properties is saturated with exchangeable bases (sum of Ca, Mg, Na, K), expressed as a percentage of the total cation-exchange capacity.

Basin floor. A general term for the nearly level, lower-most part of intermontane basins (i.e., bolson, semi-bolsions). The basin floor includes all of the alluvial, eolian, and erosional landforms below the piedmont slope.

Beach terrace. The relict shorelines from pluvial lakes, generally restricted to valley sides.

Bedding planes. Fine strata, less than 5 millimeters thick, in unconsolidated alluvial, eolian, lacustrine, or marine sediment.

Bedding system. A drainage system made by plowing, grading, or otherwise shaping the surface of a flat field. It consists of a series of low ridges separated by shallow, parallel dead furrows.

Bedrock. The solid rock that underlies the soil and other unconsolidated material or that is exposed at the surface.

Bedrock-controlled topography. A landscape where the configuration and relief of the landforms are determined or strongly influenced by the underlying bedrock.

Bench terrace. A raised, level or nearly level strip of earth constructed on or nearly on a contour, supported by a barrier of rocks or similar material, and designed to make the soil suitable for tillage and to prevent accelerated erosion.

Bisequum. Two sequences of soil horizons, each of which consists of an illuvial horizon and the overlying eluvial horizons.

Blowout. A shallow depression from which all or most of the soil material has been removed by wind. A blowout has a flat or irregular floor formed by a resistant layer or by an accumulation of pebbles or cobbles. In some blowouts, the water table is exposed.

Board foot. A unit of measure of the wood in lumber, logs, or trees. The amount of wood in a board one foot wide, one foot long, and one inch thick before finishing.

Bolson. A landscape term for an internally drained intermontane basin into which drainages from surrounding mountains converge inward toward a central depression.

Boulders. Rock fragments larger than 2 feet (60 centimeters) in diameter.

Breaks. The steep and very steep broken land at the border of an upland summit that is dissected by ravines.

Breast height. An average height of 4.5 feet above the ground surface; the point on a tree where diameter measurements are ordinarily taken.

Brush management. Use of mechanical, chemical, or biological methods to make conditions favorable for reseeding or to reduce or eliminate competition from woody vegetation and thus allow understory grasses and forbs to recover. Brush management increases forage production and thus reduces the hazard of erosion. It can improve the habitat for some species of wildlife.

Butte. An isolated small mountain or hill with steep or precipitous sides and a top variously flat, rounded, or pointed that may be a residual mass isolated by erosion or an exposed volcanic neck.

Calcareous soil. A soil containing enough calcium carbonate (commonly combined with magnesium carbonate) to effervesce visibly when treated with cold, dilute hydrochloric acid.

- Caldera.** A large, more or less circular depression, formed by explosion and/or collapse, which surrounds a volcanic vent or vents, and whose diameter is much greater than that of the included vent, or vents.
- Caliche.** A more or less cemented deposit of calcium carbonate in soils of warm-temperate, subhumid to arid areas. Caliche occurs as soft, thin layers in the soil or as hard, thick beds directly beneath the solum, or it is exposed at the surface by erosion.
- California bearing ratio (CBR).** The load-supporting capacity of a soil as compared to that of a standard crushed limestone, expressed as a ratio. First standardized in California. A soil having a CBR of 16 supports 16 percent of the load that would be supported by standard crushed limestone, per unit area, with the same degree of distortion.
- Canopy.** The leafy crown of trees or shrubs. (See Crown.)
- Canyon.** A long, deep, narrow, very steep sided valley with high, precipitous walls in an area of high local relief.
- Capillary water.** Water held as a film around soil particles and in tiny spaces between particles. Surface tension is the adhesive force that holds capillary water in the soil.
- Catena.** A sequence, or "chain," of soils on a landscape that formed in similar kinds of parent material but have different characteristics as a result of differences in relief and drainage.
- Cation.** An ion carrying a positive charge of electricity. The common soil cations are calcium, potassium, magnesium, sodium, and hydrogen.
- Cation-exchange capacity.** The total amount of exchangeable cations that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. The term, as applied to soils, is synonymous with base-exchange capacity but is more precise in meaning.
- Channeled.** Refers to a drainage area in which natural meandering or repeated branching and convergence of a streambed have created deeply incised cuts, either active or abandoned, in alluvial material.
- Channery soil material.** Soil material that is, by volume, 15 to 35 percent thin, flat fragments of sandstone, shale, slate, limestone, or schist as much as 6 inches (15 centimeters) along the longest axis. A single piece is called a channer.
- Chemical treatment.** Control of unwanted vegetation through the use of chemicals.
- Chiseling.** Tillage with an implement having one or more soil-penetrating points that shatter or loosen hard, compacted layers to a depth below normal plow depth.
- Clay.** As a soil separate, the mineral soil particles less than 0.002 millimeter in diameter. As a soil textural class, soil material that is 40 percent or more clay, less than 45 percent sand, and less than 40 percent silt.
- Clay depletions.** Low-chroma zones having a low content of iron, manganese, and clay because of the chemical reduction of iron and manganese and the removal of iron, manganese, and clay. A type of redoximorphic depletion.
- Clayey soil.** Silty clay, sandy clay, or clay.
- Clay film.** A thin coating of oriented clay on the surface of a soil aggregate or lining pores or root channels. Synonyms: clay coating, clay skin.
- Claypan.** A slowly permeable soil horizon that contains much more clay than the horizons above it. A claypan is commonly hard when dry and plastic or stiff when wet.
- Clearcut.** A method of forest harvesting that removes the entire stand of trees in one cutting. Reproduction is achieved artificially or by natural seeding from adjacent stands.
- Climax plant community.** The stabilized plant community on a particular site. The plant cover reproduces itself and does not change so long as the environment remains the same.
- Closed depression.** A low area completely surrounded by higher ground and having no natural outlet.
- Coarse fragments.** Mineral or rock particles larger than 2 millimeters in diameter.
- Coarse textured soil.** Sand or loamy sand.
- Cobble (or cobblestone).** A rounded, partly rounded, or angular fragment of rock 3 to 10 inches (7.6 to 25 centimeters) in diameter.
- Cobbly soil material.** Material that is 15 to 35 percent, by volume, rounded or partially rounded rock fragments 3 to 10 inches (7.6 to 25 centimeters) in diameter. Very cobbly soil material is 35 to 60 percent of these rock fragments, and extremely cobbly soil material is more than 60 percent.

- Codominant trees.** Trees whose crowns form the general level of the forest canopy and that receive full light from above but comparatively little from the sides.
- Colluvium.** Unconsolidated, unsorted earth material moved and deposited by mass movement on sideslopes and at the base of slopes.
- Commercial forest.** Forest land capable of producing 20 cubic feet or more per acre per year at the culmination of mean annual increment.
- Complex slope.** Irregular or variable slope. Planning or establishing terraces, diversions, and other water-control structures on a complex slope is difficult.
- Complex, soil.** A map unit of two or more kinds of soil or miscellaneous areas in such an intricate pattern or so small in area that it is not practical to map them separately at the selected scale of mapping. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas.
- Compressible** (in tables). Excessive decrease in volume of soft soil under load.
- Concretions.** Cemented bodies with crude internal symmetry organized around a point, a line, or a plane that typically takes the form of concentric layers visible to the naked eye. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up concretions. If formed in place, concretions of iron oxide or manganese oxide are generally considered a type of redoximorphic concentration.
- Conglomerate.** A coarse grained, clastic rock composed of rounded to subangular rock fragments more than 2 millimeters in diameter. It commonly has a matrix of sand and finer textured material. Conglomerate is the consolidated equivalent of gravel.
- Conservation cropping system.** Growing crops in combination with needed cultural and management practices. In a good conservation cropping system, the soil-improving crops and practices more than offset the soil-depleting crops and practices. Cropping systems are needed on all tilled soils. Soil-improving practices in a conservation cropping system include the use of rotations that contain grasses and legumes and the return of crop residue to the soil. Other practices include the use of green manure crops of grasses and legumes, proper tillage, adequate fertilization, and weed and pest control.
- Conservation tillage.** A tillage system that does not invert the soil and that leaves a protective amount of crop residue on the surface throughout the year.
- Consistence, soil.** Refers to the degree of cohesion and adhesion of soil material and its resistance to deformation when ruptured. Consistence includes resistance of soil material to rupture and to penetration; plasticity, toughness, and stickiness of puddled soil material; and the manner in which the soil material behaves when subject to compression. Terms describing consistence are defined in the "Soil Survey Manual."
- Contour stripcropping.** Growing crops in strips that follow the contour. Strips of grass or close-growing crops are alternated with strips of clean-tilled crops or summer fallow.
- Control section.** The part of the soil on which classification is based. The thickness varies among different kinds of soil, but, for many, it is that part of the soil profile between depths of 10 inches and 40 or 80 inches.
- Coprogenous earth (sedimentary peat).** Fecal material deposited in water by aquatic organisms.
- Corrosion.** Soil-induced electrochemical or chemical action that dissolves or weakens concrete or uncoated steel.
- Cover crop.** A close-growing crop grown primarily to improve and protect the soil between periods of regular crop production, or a crop grown between trees and vines in orchards and vineyards.
- Cropping system.** Growing crops according to a planned system of rotation and management practices.
- Crop residue management.** Returning crop residue to the soil, which helps to maintain soil structure, organic matter content, and fertility and helps to control erosion.
- Cross-slope farming.** Deliberately conducting farming operations on sloping farmland in such a way that tillage is across the general slope.
- Crown.** The upper part of a tree or shrub, including the living branches and their foliage.
- Cuesta.** A hill or ridge that has a gentle slope on one side and a steep slope on the other; specifically, an asymmetric, homoclinal ridge capped by resistant rock layers of slight or moderate dip.
- Culmination of the mean annual increment (CMAI).** The average annual increase per acre in the

volume of a stand. Computed by dividing the total volume of the stand by its age. As the stand increases in age, the mean annual increment continues to increase until mortality begins to reduce the rate of increase. The point where the stand reaches its maximum annual rate of growth is called the culmination of the mean annual increment.

Cutbanks cave (in tables). The walls of excavations tend to cave in or slough.

Decreasers. The most heavily grazed climax range plants. Because they are the most palatable, they are the first to be destroyed by overgrazing.

Deep soil. A soil that is 40 to 60 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Deferred grazing. Postponing grazing or resting grazing land for a prescribed period.

Delta. A body of alluvium having a surface that is nearly flat and fan shaped, deposited at or near the mouth of a river or stream where it enters a body of relatively quiet water, generally a sea or lake.

Dense layer (in tables). A very firm, massive layer that has a bulk density of more than 1.8 grams per cubic centimeter. Such a layer affects the ease of digging and can affect filling and compacting.

Depth, soil. Generally, the thickness of the soil over bedrock. Very deep soils are more than 60 inches deep over bedrock; deep soils, 40 to 60 inches; moderately deep, 20 to 40 inches; shallow, 10 to 20 inches; and very shallow, less than 10 inches.

Depth to rock (in tables). Bedrock is too near the surface for the specified use.

Desert pavement. On a desert surface, a layer of gravel or larger fragments that was emplaced by upward movement of the underlying sediments or that remains after finer particles have been removed by running water or the wind.

Dip slope. A slope of the land surface, roughly determined by and approximately conforming to the dip of the underlying bedrock.

Diversion (or diversion terrace). A ridge of earth, generally a terrace, built to protect downslope areas by diverting runoff from its natural course.

Divided-slope farming. A form of field stripcropping in which crops are grown in a systematic

arrangement of two strips, or bands, across the slope to reduce the hazard of water erosion. One strip is in a close-growing crop that provides protection from erosion, and the other strip is in a crop that provides less protection from erosion. This practice is used where slopes are not long enough to permit a full stripcropping pattern to be used.

Dominant trees. Trees whose crowns form the general level of the forest canopy and that receive full light from above and from the sides.

Drainage class (natural). Refers to the frequency and duration of wet periods under conditions similar to those under which the soil formed.

Alterations of the water regime by human activities, either through drainage or irrigation, are not a consideration unless they have significantly changed the morphology of the soil. Seven classes of natural soil drainage are recognized: excessively drained, somewhat excessively drained, well drained, moderately well drained, somewhat poorly drained, poorly drained, and very poorly drained. These classes are defined in the "Soil Survey Manual."

Drainage, surface. Runoff, or surface flow of water, from an area.

Drainageway. An area of ground at a lower elevation than the surrounding ground and in which water collects and is drained to a closed depression or lake or to a drainageway at a lower elevation. A drainageway may or may not have distinctly incised channels at its upper reaches or throughout its course.

Duff. A generally firm organic layer on the surface of mineral soils. It consists of fallen plant material that is in the process of decomposition and includes everything from the litter on the surface to underlying pure humus.

Dune. A mound, ridge, or hill of loose, windblown granular material (generally sand), either bare or covered with vegetation.

Ecological Site. A distinctive kind of rangeland or grazed forestland that has a unique historic potential native plant community. Ecological sites are the products of all the environmental factors that affect their development. An ecological site is capable of supporting a native plant community that has a unique kind and/or proportion of species or total vegetative production. Ecological sites in grazed forestland include both overstory and understory vegetation.

Effervescence. The quality of a soil measured when drops of diluted (1:10) hydrochloric acid (HCL) are added to the soil. The ratings are as follows:

Very slightly effervescent.....few bubbles
Slightly effervescent.....bubbles readily
Strongly effervescent.....bubbles form low foam
Violently effervescent.....bubbles form thick foam quickly

Eluviation. The movement of material in true solution or colloidal suspension from one place to another within the soil. Soil horizons that have lost material through eluviation are eluvial; those that have received material are illuvial.

Endosaturation. A type of saturation of the soil in which all horizons between the upper boundary of saturation and a depth of 2 meters are saturated.

Eolian soil material. Earthy parent material accumulated through wind action; commonly refers to sandy material in dunes or to loess in blankets on the surface.

Ephemeral stream. A stream, or reach of a stream, that flows only in direct response to precipitation. It receives *no long-continued* supply from melting snow or other source, and its channel is above the water table at all times.

Episaturation. A type of saturation indicating a perched water table in a soil in which saturated layers are underlain by one or more unsaturated layers within 2 meters of the surface.

Erosion. The wearing away of the land surface by water, wind, ice, or other geologic agents and by such processes as gravitational creep. *Erosion* (geologic). Erosion caused by geologic processes acting over long geologic periods and resulting in the wearing away of mountains and the building up of such landscape features as flood plains and coastal plains. Synonym: natural erosion.

Erosion (accelerated). Erosion much more rapid than geologic erosion, mainly as a result of human or animal activities or of a catastrophe in nature, such as a fire, that exposes the surface.

Erosion pavement. A layer of gravel or stones that remains on the surface after fine particles are removed by sheet or rill erosion.

Escarpment. A relatively continuous and steep slope or cliff breaking the general continuity of more

gently sloping land surfaces and resulting from erosion or faulting. Synonym: scarp.

Even aged. Refers to a stand of trees in which only small differences in age occur between the individuals. A range of 20 years is allowed.

Excess alkali (in tables). Excess exchangeable sodium in the soil. The resulting poor physical properties restrict the growth of plants.

Excess fines (in tables). Excess silt and clay in the soil. The soil does not provide a source of gravel or sand for construction purposes.

Excess lime (in tables). Excess carbonates in the soil that restrict the growth of some plants.

Excess salts (in tables). Excess water-soluble salts in the soil that restrict the growth of most plants.

Excess sodium (in tables). Excess exchangeable sodium in the soil. The resulting poor physical properties restrict the growth of plants.

Excess sulfur (in tables). Excessive amount of sulfur in the soil. The sulfur causes extreme acidity if the soil is drained, and the growth of most plants is restricted.

Extrusive rock. Igneous rock derived from deep-seated molten matter (magma) emplaced on the earth's surface.

Fallow. Cropland left idle in order to restore productivity through accumulation of moisture. Summer fallow is common in regions of limited rainfall where cereal grain is grown. The soil is tilled for at least one growing season for weed control and decomposition of plant residue.

Fan apron. A sheet-like mantle of relatively young alluvium covering part of an older fan piedmont surface. It somewhere buries a soil that can be traced to the edge of the fan apron.

Fan piedmont. The most extensive landform on piedmont slopes, formed by the coalescence of alluvial fans or accretions of fan aprons into one generally smooth slope.

Fan remnant. A general term for landforms that are remaining parts of older fan-landforms, that either have been dissected or partially buried.

Fan skirt. The zone of smooth, laterally-coalescing, small alluvial fans that issue from gullies cut into the fan piedmont or that are the coalescing extensions of inset fans of the fan piedmont, and that merge with the basin floor.

Fast intake (in tables). The rapid movement of water into the soil.

Fertility, soil. The quality that enables a soil to provide plant nutrients, in adequate amounts and in proper balance, for the growth of

specified plants when light, moisture, temperature, tillage, and other growth factors are favorable.

Fibric soil material (peat). The least decomposed of all organic soil material. Peat contains a large amount of well preserved fiber that is readily identifiable according to botanical origin. Peat has the lowest bulk density and the highest water content at saturation of all organic soil material.

Field moisture capacity. The moisture content of a soil, expressed as a percentage of the oven-dry weight, after the gravitational, or free, water has drained away; the field moisture content 2 or 3 days after a soaking rain; also called *normal field capacity*, *normal moisture capacity*, or *capillary capacity*.

Fill slope. A sloping surface consisting of excavated soil material from a road cut. It commonly is on the downhill side of the road.

Fine textured soil. Sandy clay, silty clay, or clay.

Firebreak. An area cleared of flammable material to stop or help control creeping or running fires. It also serves as a line from which to work and to facilitate the movement of fire fighters and equipment. Designated roads also serve as firebreaks.

First bottom. The normal flood plain of a stream, subject to frequent or occasional flooding.

Flaggy soil material. Material that is, by volume, 15 to 35 percent flagstones. Very flaggy soil material is 35 to 60 percent flagstones, and extremely flaggy soil material is more than 60 percent flagstones.

Flagstone. A thin fragment of sandstone, limestone, slate, shale, or (rarely) schist 6 to 15 inches (15 to 38 centimeters) long.

Flood plain. A nearly level alluvial plain that borders a stream and is subject to flooding unless protected artificially.

Fluvial. Of or pertaining to rivers; produced by river action, as a fluvial plain.

Foothill. A steeply sloping upland that has relief of as much as 1,000 feet (300 meters) and fringes a mountain range or high-plateau escarpment.

Foot slope. The inclined surface at the base of a hill.

Forb. Any herbaceous plant not a grass or a sedge.

Forest cover. All trees and other woody plants (underbrush) covering the ground in a forest.

Fragile (in tables). A soil that is easily damaged by use or disturbance.

Frost action (in tables). Freezing and thawing of soil moisture. Frost action can damage roads, buildings and other structures, and plant roots.

Genesis, soil. The mode of origin of the soil. Refers especially to the processes or soil-forming factors responsible for the formation of the solum, or true soil, from the unconsolidated parent material.

Gilgai. The microrelief of clayey soils that shrink and swell considerably with changes in moisture content. Usually manifested as a succession of microbasins and microknolls in nearly level areas or of microvalleys and microridges parallel with the slope.

Gleyed soil. Soil that formed under poor drainage, resulting in the reduction of iron and other elements in the profile and in gray colors.

Graded stripcropping. Growing crops in strips that grade toward a protected waterway.

Grassed waterway. A natural or constructed waterway, typically broad and shallow, seeded to grass as protection against erosion. Conducts surface water away from cropland.

Gravel. Rounded or angular fragments of rock as much as 3 inches (76 millimeters to 7.6 centimeters) in diameter. An individual piece is a pebble.

Gravelly soil material. Material that is 15 to 50 percent, by volume, rounded or angular rock fragments, not prominently flattened, as much as 3 inches (7.6 centimeters) in diameter.

Green manure crop (agronomy). A soil-improving crop grown to be plowed under in an early stage of maturity or soon after maturity.

Ground water. Water filling all the unblocked pores of underlying material below the water table.

Gully. A miniature valley with steep sides cut by running water and through which water ordinarily runs only after rainfall. The distinction between a gully and a rill is one of depth. A gully generally is an obstacle to farm machinery and is too deep to be obliterated by ordinary tillage; a rill is of lesser depth and can be smoothed over by ordinary tillage.

Gypsum. A mineral consisting of hydrous calcium sulfate.

Hard bedrock. Bedrock that cannot be excavated except by blasting or by the use of special equipment that is not commonly used in construction.

Hardpan. A hardened or cemented soil horizon, or layer. The soil material is sandy, loamy, or

clayey and is cemented by iron oxide, silica, calcium carbonate, or other substance.

Heavy metal. Inorganic substances that are solid at ordinary temperatures and are not soluble in water. They form oxides and hydroxides that are basic. Examples are copper, iron, cadmium, zinc, manganese, lead, and arsenic.

Hemic soil material (mucky peat). Organic soil material intermediate in degree of decomposition between the less decomposed fibric material and the more decomposed sapric material.

High-residue crops. Such crops as small grain and corn used for grain. If properly managed, residue from these crops can be used to control erosion until the next crop in the rotation is established. These crops return large amounts of organic matter to the soil.

Hill. A natural elevation of the land surface, rising as much as 1,000 feet above surrounding lowlands, commonly of limited summit area and having a well defined outline; hillsides generally have slopes of more than 15 percent. The distinction between a hill and a mountain is arbitrary and is dependent on local usage.

Holocene. The epoch of the Quaternary Period of geologic time, extending from the end of the Pleistocene Epoch (about 10 to 12 thousand years ago) to the present.

Horizon, soil. A layer of soil, approximately parallel to the surface, having distinct characteristics produced by soil-forming processes. In the identification of soil horizons, an uppercase letter represents the major horizons. Numbers or lowercase letters that follow represent subdivisions of the major horizons. The major horizons of mineral soil are as follows:

O horizon.--An organic layer of fresh and decaying plant residue.

A horizon.--The mineral horizon at or near the surface in which an accumulation of humified organic matter is mixed with the mineral material. Also, a plowed surface horizon, most of which was originally part of a B horizon.

E horizon.--The mineral horizon in which the main feature is loss of silicate clay, iron, aluminum, or some combination of these.

B horizon.--The mineral horizon below an A horizon. The B horizon is in part a layer of transition from the overlying A to the underlying C horizon. The B horizon also has distinctive characteristics, such as (1) accumulation of

clay, sesquioxides, humus, or a combination of these; (2) prismatic or blocky structure; (3) redder or browner colors than those in the A horizon; or (4) a combination of these.

C horizon.--The mineral horizon or layer, excluding indurated bedrock, that is little affected by soil-forming processes and does not have the properties typical of the overlying soil material. The material of a C horizon may be either like or unlike that in which the solum formed. If the material is known to differ from that in the solum, an Arabic numeral, commonly a 2, precedes the letter C.

Cr horizon.--Soft, consolidated bedrock beneath the soil.

R layer.--Consolidated bedrock beneath the soil. The bedrock commonly underlies a C horizon, but it can be directly below an A or a B horizon.

Humus. The well decomposed, more or less stable part of the organic matter in mineral soils.

Hydrologic soil groups. Refers to soils grouped according to their runoff potential. The soil properties that influence this potential are those that affect the minimum rate of water infiltration on a bare soil during periods after prolonged wetting when the soil is not frozen. These properties are depth to a seasonal high water table, the infiltration rate and permeability after prolonged wetting, and depth to a very slowly permeable layer. The slope and the kind of plant cover are not considered but are separate factors in predicting runoff.

Igneous rock. Rock formed by solidification from a molten or partially molten state. Major varieties include plutonic and volcanic rock. Examples are andesite, basalt, and granite.

Illuviation. The movement of soil material from one horizon to another in the soil profile. Generally, material is removed from an upper horizon and deposited in a lower horizon.

Impervious soil. A soil through which water, air, or roots penetrate slowly or not at all. No soil is absolutely impervious to air and water all the time.

Increasesers. Species in the climax vegetation that increase in amount as the more desirable plants are reduced by close grazing. Increasesers commonly are the shorter plants and less palatable to livestock.

Infiltration. The downward entry of water into the immediate surface of soil or other material, as

contrasted with percolation, which is movement of water through soil layers or material.

Infiltration capacity. The maximum rate at which water can infiltrate into a soil under a given set of conditions.

Infiltration rate. The rate at which water penetrates the surface of the soil at any given instant, usually expressed in inches per hour. The rate can be limited by the infiltration capacity of the soil or the rate at which water is applied at the surface.

Inset fan. A special case of the flood plain of an ephemeral stream that is confined between fan remnants, basin-floor remnants, ballenas, or closely opposed fan toeslopes.

Intake rate. The average rate of water entering the soil under irrigation. Most soils have a fast initial rate; the rate decreases with application time. Therefore, intake rate for design purposes is not a constant but is a variable depending on the net irrigation application. The rate of water intake, in inches per hour, is expressed as follows:

Less than 0.2	very low
0.2 to 0.4	low
0.4 to 0.75	moderately low
0.75 to 1.25	moderate
1.25 to 1.75	moderately high
1.75 to 2.5	high
More than 2.5	very high

Intermittent stream. A stream, or reach of a stream, that flows for prolonged periods only when it receives groundwater discharge or long, continued contributions from melting snow or other surface and shallow subsurface sources.

Intermontane basin. A generic term for wide structural depressions between mountain ranges that are partly filled with alluvium. They may be drained internally (bolsons) or externally (semi-bolsons).

Invaders. On range, plants that encroach into an area and grow after the climax vegetation has been reduced by grazing. Generally, plants invade following disturbance of the surface.

Iron depletions. Low-chroma zones having a low content of iron and manganese oxide because of chemical reduction and removal, but having a clay content similar to that of the adjacent matrix. A type of redoximorphic depletion.

Irrigation. Application of water to soils to assist in production of crops. Methods of irrigation are:

Basin.--Water is applied rapidly to nearly level plains surrounded by levees or dikes.

Border.--Water is applied at the upper end of a strip in which the lateral flow of water is controlled by small earth ridges called border dikes or borders.

Controlled flooding.--Water is released at intervals from closely spaced field ditches and distributed uniformly over the field.

Corrugation.--Water is applied to small, closely spaced furrows or ditches in fields of close-growing crops or in orchards so that it flows in only one direction.

Drip (or trickle).--Water is applied slowly and under low pressure to the surface of the soil or into the soil through such applicators as emitters, porous tubing, or perforated pipe.

Furrow.--Water is applied in small ditches made by cultivation implements. Furrows are used for tree and row crops.

Sprinkler.--Water is sprayed over the soil surface through pipes or nozzles from a pressure system.

Subirrigation.--Water is applied in open ditches or tile lines until the water table is raised enough to wet the soil.

Wild flooding.--Water, released at high points, is allowed to flow onto an area without controlled distribution.

Lacustrine deposit. Material deposited in lake water and exposed when the water level is lowered or the elevation of the land is raised.

Lagoon. The nearly level, filled depression behind the longshore bar on a barrier beach.

Lake plain. A surface marking the floor of an extinct lake, filled in by well sorted, stratified sediments.

Lake terrace. The narrow shelf produced along a lake shore and later exposed when the water recedes.

Lamella. A thin, generally horizontal layer of fine material illuviated within a very much thicker, coarser, eluviated layer.

Landform. Any recognizable form or feature on the earth's surface, having a characteristic shape, and produced by natural causes that provide an empirical description of similar portions of the earth's surface.

Landscape. A collection of related, natural landforms.

Landslide. The rapid downhill movement of a mass of soil and loose rock, generally when wet or

saturated. The speed and distance of movement, as well as the amount of soil and rock material, vary greatly.

Large stones (in tables). Rock fragments 3 inches (7.6 centimeters) or more across. Large stones adversely affect the specified use of the soil.

Leaching. The removal of soluble material from soil or other material by percolating water.

Liquid limit. The moisture content at which the soil passes from a plastic to a liquid state.

Loam. Soil material that is 7 to 27 percent clay particles, 28 to 50 percent silt particles, and less than 52 percent sand particles.

Loamy soil. Coarse sandy loam, sandy loam, fine sandy loam, very fine sandy loam, loam, silt loam, silt, clay loam, sandy clay loam, or silty clay loam.

Loess. Fine grained material, dominantly of silt-sized particles, deposited by wind.

Longshore bar. A narrow, elongate, coarse-textured ridge, built by the wave action of a pluvial lake, that extends parallel to the shore and separated it from a lagoon; both the bar and lagoon are now relict features.

Low-residue crops. Such crops as corn used for silage, peas, beans, and potatoes. Residue from these crops is not adequate to control erosion until the next crop in the rotation is established. These crops return little organic matter to the soil.

Low strength. The soil is not strong enough to support loads.

Marl. An earthy, unconsolidated deposit consisting chiefly of calcium carbonate mixed with clay in approximately equal amounts.

Masses. Concentrations of substances in the soil matrix that do not have a clearly defined boundary with the surrounding soil material and cannot be removed as a discrete unit. Common compounds making up masses are calcium carbonate, gypsum or other soluble salts, iron oxide, and manganese oxide. Masses consisting of iron oxide or manganese oxide generally are considered a type of redoximorphic concentration.

Mean annual increment (MAI). The average annual increase in volume of a tree during the entire life of the tree.

Mechanical treatment. Use of mechanical equipment for seeding, brush management, and other management practices.

Medium textured soil. Very fine sandy loam, loam, silt loam, or silt.

Merchantable trees. Trees that are of sufficient size to be economically processed into wood products.

Metamorphic rock. Rock of any origin altered in mineralogical composition, chemical composition, or structure by heat, pressure, and movement. Nearly all such rocks are crystalline.

Mineral soil. Soil that is mainly mineral material and low in organic material. Its bulk density is more than that of organic soil.

Minimum tillage. Only the tillage essential to crop production and prevention of soil damage.

Miscellaneous area. An area that has little or no natural soil and supports little or no vegetation.

Moderately coarse textured soil. Coarse sandy loam, sandy loam, or fine sandy loam.

Moderately deep soil. A soil that is 20 to 40 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Moderately fine textured soil. Clay loam, sandy clay loam, or silty clay loam.

Mollic epipedon. A thick, dark, humus-rich surface horizon (or horizons) that has high base saturation and pedogenic soil structure. It may include the upper part of the subsoil.

Morphology, soil. The physical makeup of the soil, including the texture, structure, porosity, consistence, color, and other physical, mineral, and biological properties of the various horizons, and the thickness and arrangement of those horizons in the soil profile.

Mottling, soil. Irregular spots of different colors that vary in number and size. Descriptive terms are as follows: abundance--*few*, *common*, and *many*; size--*fine*, *medium*, and *coarse*; and contrast--*faint*, *distinct*, and *prominent*. The size measurements are of the diameter along the greatest dimension. *Fine* indicates less than 5 millimeters (about 0.2 inch); *medium*, from 5 to 15 millimeters (about 0.2 to 0.6 inch); and *coarse*, more than 15 millimeters (about 0.6 inch).

Mountain. A natural elevation of the land surface, rising more than 1,000 feet above surrounding lowlands, commonly of restricted summit area (relative to a plateau) and generally having steep sides. A mountain can occur as a single, isolated mass or in a group forming a chain or range.

Muck. Dark, finely divided, well decomposed organic soil material. (See Sapric soil material.)

Mudstone. Sedimentary rock formed by induration of silt and clay in approximately equal amounts.

Munsell notation. A designation of color by degrees of three simple variables--hue, value, and chroma. For example, a notation of 10YR 6/4 is a color with hue of 10YR, value of 6, and chroma of 4.

Natric horizon. A special kind of argillic horizon that contains enough exchangeable sodium to have an adverse effect on the physical condition of the subsoil.

Neutral soil. A soil having a pH value between 6.6 and 7.3. (See Reaction, soil.)

Nodules. Cemented bodies lacking visible internal structure. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up nodules. If formed in place, nodules of iron oxide or manganese oxide are considered types of redoximorphic concentrations.

Nutrient, plant. Any element taken in by a plant essential to its growth. Plant nutrients are mainly nitrogen, phosphorus, potassium, calcium, magnesium, sulfur, iron, manganese, copper, boron, and zinc obtained from the soil and carbon, hydrogen, and oxygen obtained from the air and water.

Observed rooting depth. Depth to which roots have been observed to penetrate.

Organic matter. Plant and animal residue in the soil in various stages of decomposition.

Overstory. The trees in a forest that form the upper crown cover.

Oxbow. The horseshoe-shaped channel of a former meander, remaining after the stream formed a cutoff across a narrow meander neck.

Pan. A compact, dense layer in a soil that impedes the movement of water and the growth of roots. For example, *hardpan*, *fragipan*, *claypan*, *plowpan*, and *traffic pan*.

Parent material. The unconsolidated organic and mineral material in which soil forms.

Parna dune. An eolian dune built of sand size aggregates of clayey material that commonly occurs leeward of a playa.

Peat. Unconsolidated material, largely undecomposed organic matter, that has accumulated under excess moisture. (See Fibric soil material.)

Ped. An individual natural soil aggregate, such as a granule, a prism, or a block.

Pediment. A gently sloping erosional surface developed at the foot of a receding hill or mountain slope.

Pedisediment. A thin layer of alluvial material that mantles an erosion surface and has been transported to its present position from higher lying areas of the erosion surface.

Pedon. The smallest volume that can be called "a soil." A pedon is three dimensional and large enough to permit study of all horizons. Its area ranges from about 10 to 100 square feet (1 square meter to 10 square meters), depending on the variability of the soil.

Percolation. The downward movement of water through the soil.

Percs slowly (in tables). The slow movement of water through the soil adversely affects the specified use.

Permeability. The quality of the soil that enables water or air to move downward through the profile. The rate at which a saturated soil transmits water is accepted as a measure of this quality. In soil physics, the rate is referred to as "saturated hydraulic conductivity," which is defined in the "Soil Survey Manual." In line with conventional usage in the engineering profession and with traditional usage in published soil surveys, this rate of flow continues to be expressed as "permeability." Terms describing permeability, measured in inches per hour, are as follows:

Extremely slow	0.00 to 0.01 inch
Very slow	0.01 to 0.06 inch
Slow	0.06 to 0.2 inch
Moderately slow	0.2 to 0.6 inch
Moderate	0.6 inch to 2.0 inches
Moderately rapid	2.0 to 6.0 inches
Rapid	6.0 to 20 inches
Very rapid	more than 20 inches

Phase, soil. A subdivision of a soil series based on features that affect its use and management, such as slope, stoniness, and flooding.

pH value. A numerical designation of acidity and alkalinity in soil. (See Reaction, soil.)

Piedmont slope. The dominant slope at the foot of a mountain. Main components of the piedmont slope include pediments, alluvial fans, fan piedmonts, fan skirts and inset fans.

Piping (in tables). Formation of subsurface tunnels or pipelike cavities by water moving through the soil.

Pitting (in tables). Pits caused by melting around ice. They form on the soil after plant cover is removed.

Plasticity index. The numerical difference between the liquid limit and the plastic limit; the range of moisture content within which the soil remains plastic.

Plastic limit. The moisture content at which a soil changes from semisolid to plastic.

Plateau. An extensive upland mass with relatively flat summit area that is considerably elevated (more than 100 meters) above adjacent lowlands and separated from them on one or more sides by escarpments.

Playa. The generally dry and nearly level lake plain that occupies the lowest parts of closed depressional areas, such as those on intermontane basin floors. Temporary flooding occurs primarily in response to precipitation and runoff.

Pleistocene. The epoch of the Quaternary Period of geologic time preceding the Holocene (from approximately 2 million to 10 thousand years ago).

Plowpan. A compacted layer formed in the soil directly below the plowed layer.

Pluvial. Relating to former periods of abundant rains.

Ponding. Standing water on soils in closed depressions. Unless the soils are artificially drained, the water can be removed only by percolation or evapotranspiration.

Poor filter (in tables). Because of rapid or very rapid permeability, the soil may not adequately filter effluent from a waste disposal system.

Poorly graded. Refers to a coarse grained soil or soil material consisting mainly of particles of nearly the same size. Because there is little difference in size of the particles, density can be increased only slightly by compaction.

Poor outlets (in tables). Refers to areas where surface or subsurface drainage outlets are difficult or expensive to install.

Potential native plant community. See Climax plant community.

Potential rooting depth (effective rooting depth). Depth to which roots could penetrate if the content of moisture in the soil were adequate. The soil has no properties restricting the penetration of roots to this depth.

Prescribed burning. Deliberately burning an area for specific management purposes, under the appropriate conditions of weather and soil moisture and at the proper time of day.

Productivity, soil. The capability of a soil for producing a specified plant or sequence of plants under specific management.

Profile, soil. A vertical section of the soil extending through all its horizons and into the parent material.

Proper grazing use. Grazing at an intensity that maintains enough cover to protect the soil and maintain or improve the quantity and quality of the desirable vegetation. This practice increases the vigor and reproduction capacity of the key plants and promotes the accumulation of litter and mulch necessary to conserve soil and water.

Quartzite, metamorphic. Rock consisting mainly of quartz that formed through recrystallization of quartz-rich sandstone or chert.

Quaternary. The period of geologic time, extending from about 2 million years ago to the present and comprising two epochs, the Pleistocene (Ice Age) and Holocene (Recent).

Quartzite, sedimentary. Very hard but unmetamorphosed sandstone consisting chiefly of quartz grains.

Range condition. The present composition of the plant community on a range site in relation to the potential natural plant community for that site. Range condition is expressed as excellent, good, fair, or poor on the basis of how much the present plant community has departed from the potential.

Rangeland. Land on which the potential natural vegetation is predominantly grasses, grasslike plants, forbs, or shrubs suitable for grazing or browsing. It includes natural grasslands, savannas, many wetlands, some deserts, tundras, and areas that support certain forb and shrub communities.

Range site. An area of rangeland where climate, soil, and relief are sufficiently uniform to produce a distinct natural plant community. A range site is the product of all the environmental factors responsible for its development. It is typified by an association of species that differ from those on other range sites in kind or proportion of species or total production.

Reaction, soil. A measure of acidity or alkalinity of a soil, expressed in pH values. A soil that tests to

pH 7.0 is described as precisely neutral in reaction because it is neither acid nor alkaline. The degrees of acidity or alkalinity, expressed as pH values, are:

Ultra acid.....	less than 3.5
Extremely acid.....	3.5 to 4.4
Very strongly acid.....	4.5 to 5.0
Strongly acid.....	5.1 to 5.5
Moderately acid.....	5.6 to 6.0
Slightly acid.....	6.1 to 6.5
Neutral.....	6.6 to 7.3
Slightly alkaline (mildly alkaline).....	7.4 to 7.8
Moderately alkaline.....	7.9 to 8.4
Strongly alkaline.....	8.5 to 9.0
Very strongly alkaline.....	9.1 and higher

Redoximorphic concentrations. Nodules, concretions, soft masses, pore linings, and other features resulting from the accumulation of iron or manganese oxide. An indication of chemical reduction and oxidation resulting from saturation.

Redoximorphic depletions. Low-chroma zones from which iron and manganese oxide or a combination of iron and manganese oxide and clay has been removed. These zones are indications of the chemical reduction of iron resulting from saturation.

Redoximorphic features. Redoximorphic concentrations, redoximorphic depletions, reduced matrices, a positive reaction to alpha,alpha-dipyridyl, and other features indicating the chemical reduction and oxidation of iron and manganese compounds resulting from saturation.

Reduced matrix. A soil matrix that has low chroma in situ because of chemically reduced iron (Fe II). The chemical reduction results from nearly continuous wetness. The matrix undergoes a change in hue or chroma within 30 minutes after exposure to air as the iron is oxidized (Fe III). A type of redoximorphic feature.

Regeneration. The new growth of a natural plant community, developing from seed.

Regolith. The unconsolidated mantle of weathered rock and soil material on the earth's surface; the loose earth material above the solid rock.

Relict stream terrace. One of a series of platforms in or adjacent to a stream valley that formed prior to the current stream system.

Relief. The elevations or inequalities of a land surface, considered collectively.

Residuum (residual soil material). Unconsolidated, weathered or partly weathered mineral material that accumulated as consolidated rock disintegrated in place.

Rill. A steep-sided channel resulting from accelerated erosion. A rill is generally a few inches deep and not wide enough to be an obstacle to farm machinery.

Riverwash. Unstable areas of sandy, silty, clayey, or gravelly sediments. These areas are flooded, washed, and reworked by rivers so frequently that they support little or no vegetation.

Road cut. A sloping surface produced by mechanical means during road construction. It is commonly on the uphill side of the road.

Rock fragments. Rock or mineral fragments having a diameter of 2 millimeters or more; for example, pebbles, cobbles, stones, and boulders.

Rock outcrop. Exposures of bare bedrock other than lava flows and rock-lined pits.

Rooting depth (in tables). Shallow root zone. The soil is shallow over a layer that greatly restricts roots.

Root zone. The part of the soil that can be penetrated by plant roots.

Rubble land. Areas that have more than 90 percent of the surface covered by stones or boulders. Voids contain no soil material and virtually no vegetation other than lichens. The areas commonly are at the base of mountain slopes, but some are on mountain slopes as deposits of cobbles, stones, and boulders left by Pleistocene glaciation or by periglacial phenomena.

Runoff. The precipitation discharged into stream channels from an area. The water that flows off the surface of the land without sinking into the soil is called surface runoff. Water that enters the soil before reaching surface streams is called groundwater runoff or seepage flow from ground water.

Saline soil. A soil containing soluble salts in an amount that impairs the growth of plants. A saline soil does not contain excess exchangeable sodium.

Salinity. The electrical conductivity of a saline soil. It is expressed, in millimhos per centimeter, as follows:

Nonsaline.....	0 to 2
Very slightly saline.....	2 to 4
Slightly saline.....	4 to 8

Moderately saline.....8 to 16
 Strongly saline.....More than 16

Salty water (in tables). Water that is too salty for consumption by livestock.

Sand. As a soil separate, individual rock or mineral fragments from 0.05 millimeter to 2.0 millimeters in diameter. Most sand grains consist of quartz. As a soil textural class, a soil that is 85 percent or more sand and not more than 10 percent clay.

Sand sheet. A large, irregularly shaped, surficial mantle of eolian sand.

Sandstone. Sedimentary rock containing dominantly sand-sized particles.

Sandy soil. Sand or loamy sand.

Sapric soil material (muck). The most highly decomposed of all organic soil material. Muck has the least amount of plant fiber, the highest bulk density, and the lowest water content at saturation of all organic soil material.

Saprolite. Unconsolidated residual material underlying the soil and grading to hard bedrock below.

Saturation. Wetness characterized by zero or positive pressure of the soil water. Under conditions of saturation, the water will flow from the soil matrix into an unlined auger hole.

Sawlogs. Logs of suitable size and quality for the production of lumber.

Scarification. The act of abrading, scratching, loosening, crushing, or modifying the surface to increase water absorption or to provide a more tillable soil.

Scribner's log rule. A method of estimating the number of board feet that can be cut from a log of a given diameter and length.

Second bottom. The first terrace above the normal flood plain (or first bottom) of a river.

Sedimentary rock. Rock made up of particles deposited from suspension in water. The chief kinds of sedimentary rock are conglomerate, formed from gravel; sandstone, formed from sand; shale, formed from clay; and limestone, formed from soft masses of calcium carbonate. There are many intermediate types. Some wind-deposited sand is consolidated into sandstone.

Seepage (in tables). The movement of water through the soil. Seepage adversely affects the specified use.

Semi-bolson. An intermontane basin that is drained externally by an intermittent stream.

Sequum. A sequence consisting of an illuvial horizon and the overlying eluvial horizon. (See Eluviation.)

Series, soil. A group of soils that have profiles that are almost alike, except for differences in texture of the surface layer. All the soils of a series have horizons that are similar in composition, thickness, and arrangement.

Shale. Sedimentary rock formed by the hardening of a clay deposit.

Shallow soil. A soil that is 10 to 20 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Sheet erosion. The removal of a fairly uniform layer of soil material from the land surface by the action of rainfall and surface runoff.

Shelterwood system. A forest management system requiring the removal of a stand in a series of cuts so that regeneration occurs under a partial canopy. After regeneration, a final cut removes the shelterwood and allows the stand to develop in the open as an even-aged stand. The system is well suited to sites where shelter is needed for regeneration, and it can aid regeneration of the more intolerant tree species in a stand.

Shoulder slope. The uppermost inclined surface at the top of a hillside. It is the transition zone from the back slope to the summit of a hill or mountain. The surface is dominantly convex in profile and erosional in origin.

Shrink-swell (in tables). The shrinking of soil when dry and the swelling when wet. Shrinking and swelling can damage roads, dams, building foundations, and other structures. It can also damage plant roots.

Shrub-coppice dune. A small dune that forms around shrubs or small trees.

Silica. A combination of silicon and oxygen. The mineral form is called quartz.

Silt. As a soil separate, individual mineral particles that range in diameter from the upper limit of clay (0.002 millimeter) to the lower limit of very fine sand (0.05 millimeter). As a soil textural class, soil that is 80 percent or more silt and less than 12 percent clay.

Siltstone. Sedimentary rock made up of dominantly silt-sized particles.

Similar soils. Soils that share limits of diagnostic criteria, behave and perform in a similar manner, and have similar conservation needs or

management requirements for the major land uses in the survey area.

- Sinkhole.** A depression in the landscape where limestone has been dissolved.
- Site class.** A grouping of site indexes into five to seven production capability levels. Each level can be represented by a site curve.
- Site curve (50-year).** A set of related curves on a graph that shows the average height of dominant or dominant and codominant trees for the range of ages on soils that differ in productivity. Each level is represented by a curve. The basis of the curves is the height of dominant or dominant and codominant trees that are 50 years old or are 50 years old at breast height.
- Site curve (100-year).** A set of related curves on a graph that shows the average height of dominant or dominant and codominant trees for a range of ages on soils that differ in productivity. Each level is represented by a curve. The basis of the curves is the height of dominant or dominant and codominant trees that are 100 years old or are 100 years old at breast height.
- Site index.** A designation of the quality of a forest site based on the height of the dominant stand at an arbitrarily chosen age. For example, if the average height attained by dominant and codominant trees in a fully stocked stand at the age of 50 years is 75 feet, the site index is 75.
- Skid trails.** Pathways along which logs are dragged to a common site for loading onto a logging truck.
- Slash.** The branches, bark, treetops, reject logs, and broken or uprooted trees left on the ground after logging.
- Slickens.** Accumulations of fine-textured material, such as material separated in placer-mine and ore-mill operations. Slickens from ore mills commonly consist of freshly ground rock that has undergone chemical treatment during the milling process.
- Slickensides.** Polished and grooved surfaces produced by one mass sliding past another. In soils, slickensides may occur at the bases of slip surfaces on the steeper slopes; on faces of blocks, prisms, and columns; and in swelling clayey soils, where there is marked change in moisture content.
- Slick spot.** A small area of soil having a puddled, crusted, or smooth surface and an excess of

exchangeable sodium. The soil generally is silty or clayey, is slippery when wet, and is low in productivity.

- Slippage** (in tables). Soil mass susceptible to movement downslope when loaded, excavated, or wet.
- Slope.** The inclination of the land surface from the horizontal. Percentage of slope is the vertical distance divided by horizontal distance, then multiplied by 100. Thus, a slope of 20 percent is a drop of 20 feet in 100 feet of horizontal distance. In this survey, the following slope classes are recognized:

Nearly level	0 to 2 percent
Gently sloping	2 to 4 percent
Moderately sloping	4 to 8 percent
Strongly sloping	8 to 15 percent
Moderately steep	15 to 30 percent
Steep	30 to 50 percent
Very steep	50 to 75 percent
Extremely steep	75 percent and higher

- Slope** (in tables). Slope is great enough that special practices are required to ensure satisfactory performance of the soil for a specific use.
- Slow intake** (in tables). The slow movement of water into the soil.
- Slow refill** (in tables). The slow filling of ponds, resulting from restricted permeability in the soil.
- Small stones** (in tables). Rock fragments less than 3 inches (7.6 centimeters) in diameter. Small stones adversely affect the specified use of the soil.
- Sodic (alkali) soil.** A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.
- Sodicity.** The degree to which a soil is affected by exchangeable sodium. Sodicity is expressed as a sodium adsorption ratio (SAR) of a saturation extract, or the ratio of Na^+ to $Ca^{++} + Mg^{++}$. The degrees of sodicity and their respective ratios are:

Very slight	5-12:1
Slight	13-30:1
Moderate	31-45:1
Strong	46-90:1
Very strong	more than 90:1

- Soft bedrock.** Bedrock that can be excavated with trenching machines, backhoes, small rippers,

and other equipment commonly used in construction.

Soil. A natural, three-dimensional body at the earth's surface. It is capable of supporting plants and has properties resulting from the integrated effect of climate and living matter acting on earthy parent material, as conditioned by relief over periods of time.

Soil separates. Mineral particles less than 2 millimeters in equivalent diameter and ranging between specified size limits. The names and sizes, in millimeters, of separates recognized in the United States are as follows:

Very coarse sand	2.0 to 1.0
Coarse sand	1.0 to 0.5
Medium sand	0.5 to 0.25
Fine sand	0.25 to 0.10
Very fine sand	0.10 to 0.05
Silt	0.05 to 0.002
Clay	less than 0.002

Solum. The upper part of a soil profile, above the C horizon, in which the processes of soil formation are active. The solum in soil consists of the A, E, and B horizons. Generally, the characteristics of the material in these horizons are unlike those of the material below the solum. The living roots and plant and animal activities are largely confined to the solum.

Species. A single, distinct kind of plant or animal having certain distinguishing characteristics.

Stone line. A concentration of coarse fragments in a soil. Generally, it is indicative of an old weathered surface. In a cross section, the line may be one fragment or more thick. It generally overlies material that weathered in place and is overlain by recent sediment of variable thickness.

Stones. Rock fragments 10 to 24 inches (25 to 60 centimeters) in diameter if rounded or 15 to 24 inches (38 to 60 centimeters) in length if flat.

Stony. Refers to a soil containing stones in numbers that interfere with or prevent tillage.

Strath terrace. A surface cut formed by the erosion of hard or semiconsolidated bedrock and thinly mantled with stream deposits.

Stream channel. The hollow bed where a natural stream of surface water flows or may flow; the deepest or central part of the bed, formed by the main current and covered more or less continuously by water.

Stream terrace. One of a series of platforms in a stream valley, flanking and more or less parallel to the stream channel. It originally formed near the level of the stream and is the dissected remnants of an abandoned flood plain, streambed, or valley floor that were produced during a former stage of erosion or deposition.

Stripcropping. Growing crops in a systematic arrangement of strips or bands that provide vegetative barriers to soil blowing and water erosion.

Structure, soil. The arrangement of primary soil particles into compound particles or aggregates. The principal forms of soil structure are: *platy* (laminated), *prismatic* (vertical axis of aggregates longer than horizontal), *columnar* (prisms with rounded tops), *blocky* (angular or subangular), and *granular*. *Structureless* soils are either *single grain* (each grain by itself, as in dune sand) or *massive* (the particles adhering without any regular cleavage, as in many hardpans).

Stubble mulch. Stubble or other crop residue left on the soil or partly worked into the soil. It protects the soil from wind and water erosion after harvest, during preparation of a seedbed for the next crop, and during the early growing period of the new crop.

Subsoil. Technically, the B horizon; roughly, the part of the solum below plow depth.

Subsoiling. Tilling a soil below normal plow depth, ordinarily to shatter a hardpan or claypan.

Substratum. The part of the soil below the solum.

Subsurface layer. Any surface soil horizon (A, E, AB, or EB) below the surface layer.

Summer fallow. The tillage of uncropped land during the summer to control weeds and allow storage of moisture in the soil for the growth of a later crop. A practice common in semiarid regions, where annual precipitation is not enough to produce a crop every year. Summer fallow is frequently practiced before planting winter grain.

Summit. A general term for the top, or highest level, of an upland feature, such as a hill or mountain. It commonly refers to a higher area that has a gentle slope and is flanked by steeper slopes.

Surface layer. The soil ordinarily moved in tillage, or its equivalent in uncultivated soil, ranging in depth from 4 to 10 inches (10 to 25 centimeters). Frequently designated as the "plow layer" or the "Ap horizon."

Surface soil. The A, E, AB, and EB horizons, considered collectively. It includes all subdivisions of these horizons.

Tailwater. The water directly downstream of a structure.

Talus. Fragments of rock and other soil material accumulated by gravity at the foot of cliffs or steep slopes.

Taxadjuncts. Soils that cannot be classified in a series recognized in the classification system. Such soils are named for a series they strongly resemble and are designated as taxadjuncts to that series because they differ in ways too small to be of consequence in interpreting their use and behavior. Soils are recognized as taxadjuncts only when one or more of their characteristics are slightly outside the range defined for the family of the series for which the soils are named.

Terrace. An embankment, or ridge, constructed across sloping soils on the contour or at a slight angle to the contour. The terrace intercepts surface runoff so that water soaks into the soil or flows slowly to a prepared outlet. A terrace in a field is generally built so that the field can be farmed. A terrace intended mainly for drainage has a deep channel that is maintained in permanent sod.

Terrace (geologic). A step-like surface, ordinarily flat or undulating, bordering a river, a lake, or the sea representing a former flood plain.

Texture, soil. The relative proportions of sand, silt, and clay particles in a mass of soil. The basic textural classes, in order of increasing proportion of fine particles, are *sand, loamy sand, sandy loam, loam, silt loam, silt, sandy clay loam, clay loam, silty clay loam, sandy clay, silty clay*, and *clay*. The sand, loamy sand, and sandy loam classes may be further divided by specifying "coarse," "fine," or "very fine."

Thin layer (in tables). Otherwise suitable soil material too thin for the specified use.

Till plain. An extensive area of nearly level to undulating soils underlain by glacial till.

Tilth, soil. The physical condition of the soil as related to tillage, seedbed preparation, seedling emergence, and root penetration.

Toe slope. The outermost inclined surface at the base of a hill; part of a foot slope.

Too arid (in tables). The soil is dry most of the time, and vegetation is difficult to establish.

Topsoil. The upper part of the soil, which is the most favorable material for plant growth. It is ordinarily rich in organic matter and is used to topdress roadbanks, lawns, and land affected by mining.

Toxicity (in tables). Excessive amount of toxic substances, such as sodium or sulfur, that severely hinder establishment of vegetation or severely restrict plant growth.

Trace elements. Chemical elements, for example, zinc, cobalt, manganese, copper, and iron, in soils in extremely small amounts. They are essential to plant growth.

Trafficability. The degree to which a soil is capable of supporting vehicular traffic across a wide range in soil moisture conditions.

Tread. The relatively flat terrace surface that was cut or built by stream or wave action.

Tuff. A compacted deposit that is 50 percent or more volcanic ash and dust.

Understory. Any plants in a forest community that grow to a height of less than 5 feet.

Unstable fill (in tables). Risk of caving or sloughing on banks of fill material.

Upland (geology). Land at a higher elevation, in general, than the alluvial plain or stream terrace; land above the lowlands along streams.

Valley. An elongated depressional area primarily developed by stream action.

Valley fill. In glaciated regions, material deposited in stream valleys by glacial meltwater. In nonglaciated regions, alluvium deposited by heavily loaded streams.

Variation. Refers to patterns of contrasting colors assumed to be inherited from the parent material rather than to be the result of poor drainage.

Very deep soil. A soil that is more than 60 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Very shallow soil. A soil that is less than 10 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Water bars. Smooth, shallow ditches or depressional areas that are excavated at an angle across a sloping road. They are used to reduce the downward velocity of water and divert it off and away from the road surface. Water bars can easily be driven over if constructed properly.

Waterspreading. Diverting runoff from natural channels by means of a system of dams, dikes,

or ditches and spreading it over relatively flat surfaces.

Water supplying capacity. The total amount of water available in the soil for plant growth in a normal year from precipitation and from runoff from higher areas. Runoff and water lost to deep percolation are not included.

Weathering. All physical and chemical changes produced in rocks or other deposits at or near the earth's surface by atmospheric agents. These changes result in disintegration and decomposition of the material.

Well graded. Refers to soil material consisting of

coarse grained particles that are well distributed over a wide range in size or diameter. Such soil normally can be easily increased in density and bearing properties by compaction. Contrasts with poorly graded soil.

Wilting point (or permanent wilting point). The moisture content of soil, on an oven-dry basis, at which a plant (specifically, a sunflower) wilts so much that it does not recover when placed in a humid, dark chamber.

Windthrow. The uprooting and tipping over of trees by the wind.

TABLES

TABLE 1.--TEMPERATURE AND PRECIPITATION

(Recorded in the period 1961-90 at Montello, Nevada)

Month	Temperature (Degrees F.)						Precipitation (Inches)				
	Average daily maximum	Average daily minimum	Average daily	2 years in 10 will have		Average growing degree days*	Average	2 years in 10 will have--		Average number of days with 0.10 inch or more	Total snow fall
				Maximum temperature higher than--	Minimum temperature higher than--			less than	more than		
January	36.1	9.4	22.8	55	-22	4	0.43	0.19	0.70	1	4.5
February	41.7	16.3	29.0	60	-10	6	0.44	0.19	0.74	1	2.8

Average number of days per year with at least 1 inch of snow on the ground: 68

*A growing degree day is a unit of heat available for plant growth. It can be calculated by adding the maximum and minimum daily temperatures, dividing the sum by 2, and subtracting the temperature below which growth is minimal for the principal crops in the area (40 degrees F).

TABLE 2.--FREEZE DATES IN SPRING AND FALL
(Recorded in the period 1961-90 at Montello, Nevada.)

Probability	Temperature		
	24 degrees F. or lower	28 degrees F. or lower	32 degrees F. or lower
Last freezing temperature in spring:			
1 year in 10 later than--	May 23	June 15	June 27
2 years in 10 later than--	May 17	June 7	June 20
5 years in 10 later than--	May 6	May 23	June 6
First freezing temperature in fall:			
1 year in 10 earlier than--	September 10	September 1	August 23
2 years in 10 earlier than--	September 16	September 8	August 29
5 years in 10 earlier than--	September 28	September 19	September 9

TABLE 2.--FREEZE DATES IN SPRING AND FALL
(Recorded in the period 1961-90 at Wells, Nevada.)

Probability	Temperature		
	24 degrees F. or lower	28 degrees F. or lower	32 degrees F. or lower
Last freezing temperature in spring:			
1 year in 10 later than--	June 6	June 20	July 8
2 years in 10 later than--	May 30	June 13	July 2
5 years in 10 later than--	May 16	May 29	June 19
First freezing temperature in fall:			
1 year in earlier than--	September 4	August 23	August 11
2 years in 10 earlier than--	September 11	August 31	August 18
5 years in 10 earlier than--	September 24	September 14	August 29

TABLE 3.--GROWING SEASON

(Recorded in the period 1961-90 at Montello, Nevada)

Probability	Daily Minimum Temperature during growing season		
	Higher than 24 degrees F.	Higher than 28 degrees F.	Higher than 32 degrees F.
	<u>Days</u>	<u>Days</u>	<u>Days</u>
9 years in 10	118	91	67
8 years in 10	127	101	77
5 years in 10	144	120	97
2 years in 10	161	139	116
1 year in 10	170	149	127

TABLE 3.--GROWING SEASON

(Recorded in the period 1948-93 at Wells, Nevada.)

Probability	Daily Minimum Temperature during growing season		
	Higher than 24 degrees F.	Higher than 28 degrees F.	Higher than 32 degrees F.
	<u>Days</u>	<u>Days</u>	<u>Days</u>
9 years in 10	94	68	35
8 years in 10	105	79	45
5 years in 10	125	100	65
2 years in 10	145	120	85
1 year in 10	156	131	96

Wiffo variant-----	Poorly suited-----	Droughty, large stones.

TABLE 6.--SUITABILITY FOR RANGELAND SEEDING--Continued

Soil name and map symbol	Limitation rating	Restrictive features
2030:		
Cavehill-----	Poorly suited-----	Small stones.
Nirac-----	Suited-----	Too arid.
Gollaher-----	Poorly suited-----	Droughty, small stones, depth to rock.
2040:		
Sodhouse-----	Poorly suited-----	Too arid, droughty, excess sodium.
Loray-----	Poorly suited-----	Too arid.
2042:		
Sodhouse-----	Poorly suited-----	Too arid, droughty, excess sodium.
Pibler-----	Poorly suited-----	Too arid, droughty, small stones.
2050:		
Hopeka-----	Poorly suited-----	Droughty, small stones, depth to rock.
Tecomar-----	Poorly suited-----	Droughty, small stones.
2051:		
Hopeka-----	Poorly suited-----	Droughty, small stones, depth to rock.
Kzin-----	Poorly suited-----	Droughty, small stones, depth to rock.
Rock outcrop-----	Not rated-----	
2053:		
Hopeka-----	Poorly suited-----	Droughty, small stones, depth to rock.
Tecomar-----	Poorly suited-----	Droughty, small stones.
Nirac-----	Suited-----	Too arid.
2054:		
Hopeka-----	Poorly suited-----	Droughty, small stones, depth to rock.
Rock outcrop-----	Not rated-----	
2060:		
Appian-----	Poorly suited-----	Too arid, rooting depth, excess sodium.
Kawich-----	Poorly suited-----	Too arid, droughty, too sandy.
Kawich-----	Poorly suited-----	Too arid, excess salt.

TABLE 6.--SUITABILITY FOR RANGELAND SEEDING--Continued

Soil name and map symbol	Limitation rating	Restrictive features
2070:		
Kawich-----	Poorly suited-----	Too arid, excess salt.
Kawich-----	Poorly suited-----	Too arid, droughty, too sandy.
Ixian-----	Poorly suited-----	Excess salt, excess sodium.
2080:		
Toano-----	Poorly suited-----	Too arid.
Toano-----	Poorly suited-----	Too arid, excess salt.
2081:		
Toano-----	Poorly suited-----	Too arid.
Tulase-----	Suited-----	Too arid.
2090:		
Toano-----	Poorly suited-----	Too arid, excess salt.
Enko-----	Suited-----	Too arid, excess salt, excess sodium.
Sondoa-----	Poorly suited-----	Too arid, excess salt, excess sodium.
3001:		
Ixian-----	Poorly suited-----	Excess salt, excess sodium.
Valmy-----	Poorly suited-----	Too arid, excess salt, excess sodium.
3008:		
Tecomar-----	Poorly suited-----	Droughty, small stones.
Sumine-----	Poorly suited-----	Small stones.
Kram-----	Poorly suited-----	Droughty, small stones, excess salt.
3009:		
Tecomar-----	Poorly suited-----	Droughty, small stones.
Shalclev-----	Poorly suited-----	Droughty, small stones, depth to rock.
Gollaher-----	Poorly suited-----	Droughty, small stones, depth to rock.

TABLE 6.--SUITABILITY FOR RANGELAND SEEDING--Continued

Soil name and map symbol	Limitation rating	Restrictive features
3010:		
Tecomar-----	Poorly suited-----	Droughty, large stones.
Hopeka-----	Poorly suited-----	Droughty, small stones, depth to rock.
Gollaher-----	Poorly suited-----	Droughty, small stones, depth to rock.
3012:		
Tecomar-----	Poorly suited-----	Droughty, large stones.
Kram-----	Poorly suited-----	Droughty, small stones, excess salt.
Amtoft-----	Poorly suited-----	Droughty, small stones.
3013:		
Tecomar-----	Poorly suited-----	Droughty, large stones.
Hopeka-----	Poorly suited-----	Droughty, small stones, depth to rock.
Rock outcrop-----	Not rated-----	
3014:		
Tecomar-----	Poorly suited-----	Droughty, small stones.
Kzin-----	Poorly suited-----	Droughty, small stones, depth to rock.
Hopeka-----	Poorly suited-----	Droughty, small stones, depth to rock.
3015:		
Tecomar-----	Poorly suited-----	Droughty, small stones.
Kzin-----	Poorly suited-----	Droughty, small stones, depth to rock.
3016:		
Tecomar-----	Poorly suited-----	Droughty, small stones.
Izar-----	Poorly suited-----	Droughty, small stones.
Hundraw-----	Poorly suited-----	Too arid, droughty, depth to rock.
3017:		
Tecomar-----	Poorly suited-----	Droughty, small stones.
Amtoft-----	Poorly suited-----	Droughty, small stones.
Shivlum-----	Suited-----	Too arid.

TABLE 6.--SUITABILITY FOR RANGELAND SEEDING--Continued

Soil name and map symbol	Limitation rating	Restrictive features
3018:		
Tecomar-----	Poorly suited-----	Droughty, small stones.
Nirac-----	Suited-----	Too arid.
Kram-----	Poorly suited-----	Droughty, small stones, excess salt.
3019:		
Tecomar-----	Poorly suited-----	Droughty, small stones.
Hopeka-----	Poorly suited-----	Droughty, small stones, depth to rock.
Ekim-----	Suited-----	Too arid, droughty.
3020:		
Amtoft-----	Poorly suited-----	Droughty, small stones.
Tecomar-----	Poorly suited-----	Droughty, large stones.
Kzin-----	Poorly suited-----	Droughty, small stones, depth to rock.
3021:		
Amtoft-----	Poorly suited-----	Droughty, small stones.
Tecomar-----	Poorly suited-----	Droughty, large stones.
Rock outcrop-----	Not rated-----	
3023:		
Amtoft-----	Poorly suited-----	Droughty, small stones.
Jericho-----	Poorly suited-----	Too arid, droughty.
Tecomar-----	Poorly suited-----	Droughty, large stones.
3025:		
Amtoft-----	Poorly suited-----	Droughty, small stones.
Arcia-----	Suited-----	Too arid.
Kram-----	Poorly suited-----	Droughty, small stones, excess salt.
3030:		
Cobre-----	Suited-----	Too arid.
Izar-----	Poorly suited-----	Droughty, small stones.
Jackpot-----	Suited-----	Too arid, depth to rock.

TABLE 6.--SUITABILITY FOR RANGELAND SEEDING--Continued

Soil name and map symbol	Limitation rating	Restrictive features
3031: Cobre-----	Suited-----	Too arid.
Hundraw-----	Poorly suited-----	Too arid, droughty, depth to rock.
Jackpot-----	Suited-----	Too arid, depth to rock.
3032: Cobre-----	Suited-----	Too arid.
Hundraw-----	Poorly suited-----	Too arid, droughty, depth to rock.
Anowell-----	Poorly suited-----	Droughty, depth to rock.
3033: Cobre-----	Suited-----	Too arid.
Hundraw-----	Poorly suited-----	Too arid, droughty, depth to rock.
Zapa-----	Poorly suited-----	Droughty, small stones.
3036: Cobre-----	Suited-----	Too arid.
Enko-----	Suited-----	Too arid, excess salt, excess sodium.
3040: Player-----	Suited-----	Too arid, erodes easily.
McIvey-----	Well suited-----	
Hogmalat-----	Poorly suited-----	Droughty, small stones.
3070: Arva-----	Well suited-----	
Chen-----	Poorly suited-----	Too arid, droughty, small stones.
Sumine-----	Poorly suited-----	Small stones.
3080: Fenelon-----	Suited-----	Too arid.
Lerrow variant-----	Poorly suited-----	Rooting depth.
Cotant-----	Poorly suited-----	Droughty, rooting depth.

TABLE 6.--SUITABILITY FOR RANGELAND SEEDING--Continued

Soil name and map symbol	Limitation rating	Restrictive features
3081:		
Fenelon-----	Suited-----	Too arid.
Gochea-----	Suited-----	Too arid.
3100:		
Kleckner-----	Poorly suited-----	Rooting depth.
Stampede-----	Poorly suited-----	Rooting depth.
4000:		
Wicup-----	Suited-----	Too arid.
Anowell-----	Poorly suited-----	Droughty, depth to rock.
Kzin-----	Poorly suited-----	Droughty, small stones, depth to rock.
4001:		
Wicup-----	Suited-----	Too arid.
Fenelon-----	Suited-----	Too arid.
Akler-----	Poorly suited-----	Droughty, rooting depth.
4002:		
Wicup-----	Suited-----	Too arid.
Gochea-----	Suited-----	Too arid.
Gumble-----	Poorly suited-----	Droughty, rooting depth.
4020:		
Akler-----	Poorly suited-----	Droughty, small stones, rooting depth.
Cleavage-----	Poorly suited-----	Droughty, small stones.
Elocin-----	Suited-----	Too arid.
4040:		
Kram-----	Poorly suited-----	Droughty, small stones, excess salt.
Amtoft-----	Poorly suited-----	Droughty, small stones.
Nirac-----	Suited-----	Too arid.

TABLE 6.--SUITABILITY FOR RANGELAND SEEDING--Continued

Soil name and map symbol	Limitation rating	Restrictive features
4041:		
Kram-----	Poorly suited-----	Droughty, small stones, excess salt.
Tecomar-----	Poorly suited-----	Droughty, small stones.
4042:		
Kram-----	Poorly suited-----	Droughty, small stones, excess salt.
Hooplite-----	Poorly suited-----	Too arid, droughty, small stones.
Yuko-----	Poorly suited-----	Too arid, droughty, rooting depth.

TABLE 7.--WOODLAND MANAGEMENT AND PRODUCTIVITY

(Only the soils suitable for production of commercial trees are listed)

Map symbol and soil name	Ordi- nation symbol	Management concerns					Potential productivity

TABLE 14.--CLASSIFICATION OF THE SOILS

Soil name	Family or higher taxonomic class
Ackett-----	Xerollic Durargids, clayey-skeletal, montmorillonitic, mesic, shallow
Affey-----	Durargidic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Agassiz-----	Lithic Haploxerolls, loamy-skeletal, mixed, frigid
Agort-----	Entic Haploxerolls, loamy, mixed, frigid, shallow
Akler-----	Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Amene-----	Lithic Calcixerolls, loamy-skeletal, carbonatic, frigid
Amtoft-----	Lithic Xerollic Calciorthis, loamy-skeletal, carbonatic, mesic
Anowell-----	Xerollic Haplargids, loamy, mixed, mesic, shallow
Appian-----	Typic Natrargids, fine-loamy over sandy or sandy-skeletal, mixed, mesic
Arcia-----	Pachic Argixerolls, fine, montmorillonitic, frigid
Arva-----	Pachic Argixerolls, fine, montmorillonitic, frigid
Ashart-----	Mollic Haploxeralfs, loamy, mixed, mesic, shallow
Bancy-----	Typic Durixerolls, clayey, montmorillonitic, frigid, shallow
Batan-----	Durorthidic Torriorthents, fine-silty, mixed (calcareous), mesic
Belsac-----	Pachic Cryoborolls, loamy-skeletal, mixed
Belsac Variant-----	Entic Cryumbrepts, loamy-skeletal, mixed
Bilbo-----	Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Bluehill-----	Vitrandic Xerochrepts, ashy, mesic
Booford-----	Typic Argixerolls, fine, montmorillonitic, frigid
Boso-----	Aridic Petrocalcic Palexerolls, loamy-skeletal, mixed, frigid, shallow
Bullump-----	Pachic Argixerolls, loamy-skeletal, mixed, frigid
Cameek-----	Aridic Durixerolls, clayey, montmorillonitic, frigid, shallow
Cavehill-----	Typic Calcixerolls, loamy-skeletal, carbonatic, frigid
Chayson-----	Typic Durixerolls, fine-loamy, mixed, frigid
Chen-----	Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Chiara-----	Xerollic Durorthids, loamy, mixed, mesic, shallow
Chuska-----	Xerollic Durargids, loamy, mixed, mesic, shallow
Cleavage-----	Lithic Argixerolls, loamy-skeletal, mixed, frigid
Cobre-----	Vitrixrandic Camborthids, ashy, mesic
Contact-----	Entic Haploxerolls, sandy, mixed, frigid
Coser-----	Typic Palexerolls, fine, montmorillonitic, frigid
Cotant-----	Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Croesus-----	Pachic Cryoborolls, loamy-skeletal, mixed
Crooked Creek-----	Cumulic Haplaquolls, fine, montmorillonitic, frigid
Dacker-----	Xerollic Durargids, fine-loamy, mixed, mesic
Deleplain-----	Aeric Fluvaquents, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Devilsgait-----	Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Dewar-----	Xerollic Durargids, loamy, mixed, mesic, shallow
Donna-----	Abruptic Aridic Durixerolls, very-fine, montmorillonitic, frigid
Earcree-----	Pachic Cryoborolls, coarse-loamy, mixed
Eboda-----	Aridic Argixerolls, fine-loamy, mixed, frigid
Ekim-----	Aridic Calcixerolls, loamy-skeletal, carbonatic, frigid
Elhina-----	Abruptic Xerollic Durargids, fine, montmorillonitic, frigid
Elocin-----	Aridic Palexerolls, clayey-skeletal, montmorillonitic, frigid
Enko-----	Durixerollic Camborthids, coarse-loamy, mixed, mesic
Fenelon-----	Aridic Calcic Argixerolls, fine-loamy, mixed, frigid
Fez-----	Vitrandic Haploxerolls, ashy, frigid
Forvic-----	Typic Durixerolls, fine, montmorillonitic, frigid
Gance-----	Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Geysen-----	Durixerollic Natrargids, fine-loamy, mixed, mesic
Gochea-----	Durargidic Argixerolls, fine-loamy, mixed, frigid
Gollaher-----	Lithic Xerorthents, loamy-skeletal, carbonatic, frigid
Golsum-----	Aridic Calcic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Graley-----	Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Gravler-----	Typic Calciorthis, loamy-skeletal, mixed, mesic
Grina-----	Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Gumble-----	Xerollic Haplargids, clayey, montmorillonitic, mesic, shallow
Hackwood-----	Pachic Cryoborolls, fine-loamy, mixed

TABLE 14.--CLASSIFICATION OF THE SOILS--Continued

Soil name	Family or higher taxonomic class
Halleck	Cumulic Haplaquolls, fine-silty, mixed (calcareous), frigid
Hapgood	Pachic Cryoborolls, loamy-skeletal, mixed
Hardhat	Durorthidic Torriorthents, coarse-loamy, mixed (calcareous), mesic
Heckison	Aridic Durixerolls, fine-loamy, mixed, frigid
Hogmalat	Argic Lithic Cryoborolls, loamy-skeletal, mixed
Holborn	Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Hooplite	Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Hopeka	Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, frigid
Hundraw	Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Hunewill	Xerollic Haplargids, loamy-skeletal, mixed, mesic
Hunnton	Xerollic Durargids, fine, montmorillonitic, mesic
Hussell	Durixerollic Haplargids, coarse-loamy, mixed, mesic
Igdell	Abruptic Aridic Durixerolls, fine, montmorillonitic, frigid
Ixian	Argic Torriorthents, fine-silty, mixed (calcareous), mesic
Izar	Lithic Xeric Torriorthents, loamy-skeletal, mixed (calcareous), mesic
Izod	Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Jackpot	Xeric Torriorthents, nonacid, ashy, mesic, shallow
Jericho	Xerollic Durorthids, loamy-skeletal, mixed, mesic, shallow
Kawich	Typic Torripsamments, mixed, mesic
Kelk	Durixerollic Camborthids, fine-silty, mixed, mesic
Keman	Argic Pachic Cryoborolls, loamy-skeletal, mixed
Kleckner	Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Kram	Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Kzin	Xeric Torriorthents, loamy-skeletal, mixed (calcareous), mesic, shallow
Lerrow	Aridic Argixerolls, fine, montmorillonitic, frigid
Lerrow Variant	Calcic Pachic Argixerolls, fine, montmorillonitic, frigid
Loncan	Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Loomis	Lithic Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Loray	Typic Calciorthids, sandy-skeletal, mixed, mesic
Luap	Typic Paleorthids, loamy-skeletal, mixed, mesic
McIvey	Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Nevador	Durixerollic Haplargids, fine-loamy, mixed, mesic
Nirac	Aridic Calcixerolls, loamy-skeletal, mixed, frigid
Ocala	Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Ocala Variant	Typic Halaquepts, fine, montmorillonitic (calcareous), mesic
Ola	Pachic Haploxerolls, coarse-loamy, mixed, frigid
Onkeyo	Lithic Calcixerolls, loamy-skeletal, mixed, frigid
Orovada	Durixerollic Camborthids, coarse-loamy, mixed, mesic
Oupicc	Xerollic Durorthids, coarse-loamy, mixed, mesic
Pamison	Aridic Calcixerolls, loamy-skeletal, mixed, frigid
Peeko	Xerollic Durorthids, loamy, mixed, mesic, shallow
Pequop	Typic Argixerolls, loamy-skeletal, mixed, frigid
Pernty	Lithic Argixerolls, loamy-skeletal, mixed, frigid
Pibler	Xerollic Paleorthids, loamy-skeletal, mixed, mesic, shallow
Player	Ultic Palexerolls, clayey-skeletal, montmorillonitic, frigid
Puett	Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Quarz	Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Quopant	Typic Argixerolls, loamy-skeletal, mixed, frigid, shallow
Rodie	Aridic Duric Haploxerolls, loamy-skeletal, mixed, frigid
Scalfar	Calcic Argixerolls, loamy-skeletal, mixed, frigid
Shafter	Typic Paleorthids, loamy, mixed, mesic, shallow
Shalcleav	Lithic Argixerolls, loamy-skeletal, mixed, frigid
Shalper	Lithic Argixerolls, loamy-skeletal, mixed, frigid
Shivlum	Aridic Argixerolls, fine-silty, mixed, frigid
Shuttle	Durorthidic Torriorthents, coarse-loamy, mixed (calcareous), mesic
Simon	Aridic Argixerolls, fine-loamy, mixed, frigid
Snotown	Dystric Cryochrepts, loamy-skeletal, mixed
Sodhouse	Typic Durorthids, loamy, mixed, mesic, shallow
Sondoa	Typic Torriorthents, fine-silty, mixed (calcareous), mesic
Sonoma	Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Soughe	Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Stampede	Aridic Durixerolls, fine, montmorillonitic, frigid
Sumine	Aridic Argixerolls, loamy-skeletal, mixed, frigid

TABLE 14.--CLASSIFICATION OF THE SOILS--Continued

Soil name	Family or higher taxonomic class
Tecomar-----	Lithic Xerollic Calciorthiss, loamy-skeletal, carbonatic, mesic
Toano-----	Typic Torriorthents, coarse-silty, mixed (calcareous), mesic
Tomsherry-----	Vitrandic Durixerolls, ashy, frigid
Trinidad-----	Xeric Torriorthents, loamy, carbonatic, frigid, shallow
Tulase-----	Durorthidic Xeric Torriorthents, coarse-silty, mixed (calcareous), mesic
Tusel-----	Argic Pachic Cryoborolls, loamy-skeletal, mixed
Tweener-----	Lithic Argixerolls, loamy-skeletal, mixed, frigid
Vadaho-----	Orthidic Durixerolls, loamy, mixed, mesic, shallow
Valmy-----	Durorthidic Torriorthents, coarse-loamy, mixed (calcareous), mesic
Vanwyper-----	Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Vitale-----	Typic Argixerolls, loamy-skeletal, mixed, frigid
Welch-----	Cumulic Haplaquolls, fine-loamy, mixed, frigid
Wicup-----	Aridic Argixerolls, fine, montmorillonitic, mesic
Wieland-----	Durixerollic Haplargids, fine, montmorillonitic, mesic
Wiffo Variant-----	Xerollic Camborthids, loamy-skeletal, mixed, mesic
Wiffo-----	Xeric Torriorthents, loamy-skeletal, mixed (calcareous), mesic
Xerxes-----	Mollic Haploxeralfs, loamy-skeletal, mixed, mesic, shallow
Xica-----	Typic Argixerolls, loamy, mixed, frigid, shallow
Xipe-----	Fluvaquentic Haplaquolls, fine-silty over sandy or sandy-skeletal, mixed, mesic
Yuko-----	Xerollic Haplargids, loamy, mixed, mesic, shallow
Zapa-----	Haploxerollic Durorthids, loamy-skeletal, mixed, mesic
Zark-----	Mollic Vitrandepts, ashy, mesic

RANGELAND PLANTS AND WOODLAND UNDERSTORY

010--YUKO-AFLER ASSOCIATION

(Absence of an entry indicates that the named plant is not a key species in the potential native plant community)

Common plant name	Plant symbol	Percentage composition and production (dry weight) of plants on major soils and inclusions				
		Soil name or Inclusion number--				
		YUKO	AKLER	Inclusion 1	Inclusion 2	Inclusion 3
Idaho fescue	FEID	---	---	---	30-50	---
Indian ricegrass	ORHY	---	---	---	---	5-15
